PSoC® 5LP Registers TRM
(Technical Reference Manual)

Document No. 001-82120 Rev. *F

June 1, 2017

Contents

Register Mapping

Register Mapping discusses the registers of the PSoC 5LP device. It lists all the registers in mapping tables, in address order.

See the *PSoC 5LP Architecture TRM (Technical Reference Manual)* for complete functionality.

1.1　Maneuvering Around the Registers

For ease-of-use, this chapter is formatted so that there is one register per page, although some registers use two pages. On each page, from top to bottom, there are four sections:

1. Register name and address (from lowest to highest).
2. Register table showing the bit organization, with reserved bits grayed out.
3. Written description of register specifics or links to additional register information.
4. Detailed register bit descriptions.

1.2　Register Conventions

The following table lists the register conventions.

Convention	Example	Description
'x' in a register name	ACBxxCR1	Multiple instances/address ranges of the same register
R	R : 00	Read register or bit(s)
W	W : 00	Write register or bit(s)
WOC	WOC:0	Write one to clear
WZC	WZC:0	Write zero to clear
RC	RC:0	Read to clear
WC	WC:0	Write to clear
NA	NA:000	Reserved
U	R:U	Undefined
00	RW : 00	Reset value is 0x00
XX	RW : XX	Register is not reset
Empty, grayed out table cell		Reserved bit or group of bits, unless otherwise stated. Write reserved bits to zero. Software cannot make any assumptions about return values.

1.3   PSoC 5LP Register Map

The PSoC 5LP device has a total register address space of 4 GB (32-bit addressing scheme).

Register Name	Purpose	Address
FLASH_DATA[0..262143]	DATA	[0..262143 * 0x1]
SRAM_CODE64K[0..16383]	Code System Memory Bank	0x1fff8000 + [0..16383 * 0x1]
SRAM_CODE32K[0..8191]	Code System Memory Bank	0x1fffc000 + [0..8191 * 0x1]
SRAM_CODE16K[0..4095]	Code System Memory Bank	0x1fffe000 + [0..4095 * 0x1]
SRAM_CODE[0..4095]	Code System Memory Bank	0x1ffff000 + [0..4095 * 0x1]
SRAM_DATA[0..4095]	Data System Memory Bank	0x20000000 + [0..4095 * 0x1]
SRAM_DATA16K[0..4095]	Data System Memory Bank	0x20001000 + [0..4095 * 0x1]
SRAM_DATA32K[0..8191]	Data System Memory Bank	0x20002000 + [0..8191 * 0x1]
SRAM_DATA64K[0..16383]	Data System Memory Bank	0x20004000 + [0..16383 * 0x1]
DMA_SRAM64K[0..16383]	Data System Memory Bank	0x20008000 + [0..16383 * 0x1]
DMA_SRAM32K[0..8191]	Data System Memory Bank	0x2000c000 + [0..8191 * 0x1]
DMA_SRAM16K[0..4095]	Data System Memory Bank	0x2000e000 + [0..4095 * 0x1]
DMA_SRAM[0..4095]	Data System Memory Bank	0x2000f000 + [0..4095 * 0x1]
CLKDIST_CR	Configuration Register CR	0x40004000
CLKDIST_LD	LOAD Register	0x40004001
CLKDIST_WRK0	LSB Shadow Divider Value Register	0x40004002
CLKDIST_WRK1	MSB Shadow Divider Value Register	0x40004003
CLKDIST_MSTR0	Master clock (clk_sync_d) Divider Value Register	0x40004004
CLKDIST_MSTR1	Master (clk_sync_d) Configuration Register/CPU Divider Value	0x40004005
CLKDIST_BCFG0	CLK_BUS LSB Divider Value Register	0x40004006
CLKDIST_BCFG1	CLK_BUS MSB Divider Value Register	0x40004007
CLKDIST_BCFG2	CLK_BUS Configuration Register	0x40004008
CLKDIST_UCFG	USB Configuration Register	0x40004009
CLKDIST_DLY0	Delay block Configuration Register	0x4000400a
CLKDIST_DLY1	Delay block Configuration Register	0x4000400b
CLKDIST_DMASK	Digital Clock Mask Register	0x40004010
CLKDIST_AMASK	Analog Clock Mask Register	0x40004014
CLKDIST_DCFG[0..7]_CFG0	LSB Divider Value Register	0x40004080 + [0..7 * 0x4]
CLKDIST_DCFG[0..7]_CFG1	MSB Divider Value Register	0x40004080 + [0..7 * 0x4] + 0x1
CLKDIST_DCFG[0..7]_CFG2	Configuration Register	0x40004080 + [0..7 * 0x4] + 0x2
CLKDIST_ACFG[0..3]_CFG0	LSB Divider Value Register	0x40004100 + [0..3 * 0x4]
CLKDIST_ACFG[0..3]_CFG1	MSB Divider Value Register	0x40004100 + [0..3 * 0x4] + 0x1
CLKDIST_ACFG[0..3]_CFG2	Configuration Register	0x40004100 + [0..3 * 0x4] + 0x2
CLKDIST_ACFG[0..3]_CFG3	Analog clocks Configuration Register	0x40004100 + [0..3 * 0x4] + 0x3
FASTCLK_IMO_CR	Internal Main Oscillator Control Register	0x40004200

Register Name	Purpose	Address
FASTCLK_XMHZ_CSR	External 4-25 MHz Crystal Oscillator Status and Control Register	0x40004210
FASTCLK_XMHZ_CFG0	External 4-25 MHz Crystal Oscillator Configuration Register 0	0x40004212

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	DMAdata_CPUcode_sram							

Code Storage SRAM   The CODE segement is available in all SRAM variants of PSoC5.   CPU code space mapped at 1FFF8000 -- 1FFFFFFF   Same physical space logically mapped at 20008000 -- 2000FFFF for DMA access   The other CODExxK segments are only available on PSoC5 variants with that much SRAM or larger.   The Interrupt Vector Table, Interrupt Service Routines and other speed critical software should be located in this segment of RAM. Data variables can be placed here but performance will be sub-optimal due to the access conflict with fetching instructions on the C bus.   The RAM is physically 32-bits wide and is byte addressable. The RAM is zero wait-states for code fetches but data fetches will be slower due to the conflict on the C bus.

Data System Memory Bank

Reset: N/A

Register : Address

SRAM_DATA: 0x20000000-0x20000FFF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset				R/W:UUUUUUUU				
HW Access				R/W				
Retention				RET				
Name				CPU_DMA_data_sram				

Data Storage SRAM, space is accessible by CPU and DMA The DATA segement is available in all SRAM variants of PSoC5. The other DATAxxK segments are only available on PSoC5 variants with that much SRAM or larger. The Stack pointer is normally located at the top of DATA SRAM and grows downward. All data should be placed in this segement of SRAM. Code can be placed here but will result in performance degradation due to conflicts with data fetches on the S bus. There is also a 1 clock wait wait state for all code fetches across the S bus. The RAM is physically 32-bits wide and is byte addressable.

1.3.14   CLKDIST_CR

Configuration Register CR

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_CR: 0x40004000

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:00		R/W:00		R/W:00	
HW Access	NA	R	R		R		R	
Retention	NA	RET	RET		RET		RET	
Name	RSVD	IMO2X_SRC	IMO_OUT		ILO_OUT		PLL_SRC	

This register is used to configure the 4 main CLK sources. PLL_SRC - The source to the PLL reference clock input. ILO_OUT - ILO source to the clock distribution block. IMO_OUT - The source from IMO to clock distribution block. IMO2X_SRC - Source to IMO doubler. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
6	IMO2X_SRC	Selects the external clock input source to Internal Oscillator. This bit controls a 2:1 mux that drives the external clock input to the s8intosc oscillator. The oscillator itself contains another mux allowing control if the external clock or the oscillator itself is the source clock to the system clock called IMO and to the IMO frequency doubling circuit. The clock selection in the oscillator is controlled by FASTCLK_IMO_CR.XCLKEN. Because this bit can induce clock glitches, it should only be changed when no downstream clock tree is configured to use the IMO clock source, or FASTCLK_IMO_CR.XCLKEN is low at the time it is changed.
		See Table 1-2.
5:4	IMO_OUT[1:0]	Select the IMO output source to clock distribution. This clock configuration feature is primarily intended for internal use only. Changing this field can cause clock glitches. This needs either to be expected or avoided. To avoid glitches all downstream clock trees will need to be configured to a different clock source when this field is written.
		See Table 1-3.
3:2	ILO_OUT[1:0]	Select the ILO output source to clock distribution. Any clock tree using this clock as its source must be disabled before writing this register bit to avoid potential glitches.
		See Table 1-1.
1:0	PLL_SRC[1:0]	Select the PLL reference clock input. Do not change the value in this field while the PLL is the currently selected clock source for the Master Mux or USB clock (if enabled)
		See Table 1-4.

Table 1-1. Bit field encoding: ILO_OUTPUT_SEL_ENUM

Value	Name	Description
2'h0	ILO100K	100KHz output is selected
2'h1	ILO33K	33KHz output is selected
2'h2	ILO1K	1KHz output is selected

2'h3	RSVD	Reserved

1.3.15 CLKDIST_LD

LOAD Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_LD: 0x40004001

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R/W	R/W	R/W
Retention	NA					RET	RET	RET
Name	RSVD					DISABLE	SYNC_EN	LOAD

This register provides control of clock parameters while the clocks are running and does so without compromising the integrity of the clocks (glitch-free). In groups defined by the DMASK and AMASK registers, clocks can be loaded with new count values or loaded with new divide counts and started aligned together using this feature. Setting the LOAD bit immediately copies the values of the WRK0 and WRK1 registers into all divider divide registers (DCFG0/1 and ACFG0/1, BCFG0/1), which are not masked off. Setting the SYNC_EN bit forces a load and restart of all the dividers which are not masked off (excluding BUS_CLK). Using SYNC_EN restarts all affected dividers phase aligned. In order for the dividers to start phase aligned all the divide values must be integer multiples of one another. Upon setting the DISABLE register bit all dividers which are not masked off are disabled (Excluding BUS_CLK). This allows for local control of the clock trees. The SYNC_EN and LOAD bits, bits 1 and 0 respectively, in this register are cleared upon completion of loading and/or restarting. When changing configuration of any of the ACLK/DCLKs a value of 0x00 needs to be written to both WRK0 and WRK1 registers. Next a value of 0x07 has to be written to this register, LD. One has to poll this register, LD, for bits 1 and 0 (SYNC_EN and LOAD) to be cleared in order to start modifying clock tree configuration. This applies to all ACLK/DCLK configuration bits. The WRK0/1 and DMASK/AMASK register can be written in any order but both must be written before LOAD or SYNC_EN are written. The DMASK/AMASK register must be written before the DISABLE bit is written.

Bits	Name	Description
2	DISABLE	Locally disable all unmasked divders (Excluding BUS_CLK). See Table 1-5.
1	SYNC_EN	Load all unmasked dividers with a common shadow divider value and restart all unmasked dividers in phase. See Table 1-7.
0	LOAD	Load all unmasked dividers with a common shadow divider value. (does not restart them in phase) See Table 1-6.

Table 1-5. Bit field encoding: DISABLE_ENUM

Value	Name	Description
1'b0	DISABLE_0	Enable
1'b1	DISABLE_1	Disable

Table 1-6. Bit field encoding: LOAD_ENUM

Value	Name	Description
1'b0	LOAD_0	Do nothing
1'b1	LOAD_1	Copy shadow value defined in CLKDIST_WRK0 and CLKDIST_WRK1 registers to all dividers selected in CLKDIST_MSK0 and CLKDIST_MSK1 registers

1.3.15   **CLKDIST_LD** (continued)

Table 1-7. Bit field encoding: SYNC_SHADOW_ENUM

Value	Name	Description
1'b0	SYNC_0	Do nothing
1'b1	SYNC_1	Enable all dividers selected in CLKDIST_MSK register (Excluding BUS_CLK) to start (or restart) in phase. NOTE: does not load the WRK register values. This bit only phase aligns all the selected dividers with their existing divide values.

1.3.16   CLKDIST_WRK0

LSB Shadow Divider Value Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_WRK0: 0x40004002

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register is the low byte of a count value to be loaded in specified clock dividers defined by the A/DMASK registers. This register (with WRK1) holds a new count value to be atomically loaded, so that the 16 bits dividers can safely be updated dynamically. For information on how this feature is used, see the description in the LD register.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including WRK1: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... ... 0xfffe source / 65535 0xffff source / 65536

1.3.17   CLKDIST_WRK1

MSB Shadow Divider Value Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_WRK1: 0x40004003

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register is the high byte of a count value to be loaded in specified clock dividers defined by the A/DMASK registers. This register (with WRK0) holds a new count value to be atomically loaded, so that the 16 bits dividers can safely be updated dynamically. For information on how this feature is used, see the description in the LD register.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including WRK0: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... ... 0xfffe source / 65535 0xffff source / 65536

1.3.18   CLKDIST_MSTR0

Master clock (clk_sync_d) Divider Value Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_MSTR0: 0x40004004

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the master source clock 8-bit divide value. This register can be written at any time, including while the divider is running. Due to a sampling anomaly in the HW, there is a small probability that the Master divider will divide by an incorrect value (not the past or new value) for one period before stabilizing on the divide value written.

Bits	Name	Description
7:0	DIV_VAL[7:0]	0x00 source 0x01 source / 2 0x02 source / 3 ... ... 0xfe source / 255 0xff source / 256

1.3.19   CLKDIST_MSTR1

Master (clk_sync_d) Configuration Register/CPU Divider Value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

CLKDIST_MSTR1: 0x40004005

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						NONRET	
Name	RSVD						SRC_SEL	

This register holds the master clock source configuration. The register can be altered at any time without compromising clock integrity.

Bits	Name	Description
1:0	SRC_SEL[1:0]	Master clock source selection.
		See Table 1-8.

Table 1-8. Bit field encoding: MASTER_SRC_SEL_ENUM

Value	Name	Description
2'h0	IMO	imo output is selected
2'h1	PLL	pll output is selected
2'h2	XTAL	xtal_mhz output is selected
2'h3	DSI	dsi_c output is selected

1.3.20 CLKDIST_BCFG0

CLK_BUS LSB Divider Value Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_BCFG0: 0x40004006

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the LSB of the 16-bit divide value. It should only be written when the clock tree is disabled to avoid clock glitches. If the clock divider needs changed when the clock is running, this can be accomplished using the atomic load feature described in the LD register description.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG1: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... ... 0xfffe source / 65535 0xffff source / 65536

1.3.21   CLKDIST_BCFG1

CLK_BUS MSB Divider Value Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_BCFG1: 0x40004007

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DIV_VAL							

This register holds the MSB of the 16-bit divide value. It should only be written when the clock tree is disabled to avoid clock glitches. If the clock divider needs changed when the clock is running, this can be accomplished using the atomic load feature described in the LD register description.

Bits	Name	Description
7:0	DIV_VAL[7:0]	Encoding including BCFG0: 0x0000 source 0x0001 source / 2 0x0002 source / 3 ... ... 0xfffe source / 65535 0xffff source / 65536

1.3.22   CLKDIST_BCFG2

CLK_BUS Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_BCFG2: 0x40004008

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	NA:0	R/W:0	R/W:0	NA:000		
HW Access	R	R	NA	R	R	NA		
Retention	RET	RET	NA	RET	RET	NA		
Name	MASK	SSS	RSVD	DUTY	SYNC	RSVD		

This register holds the configuraton values for the Bus Clock. The EARLY bit should never be used and should never be set HIGH. The DUTY bit should never be written when the divider is in use to avoid clock glitches. The SSS and SYNC_EN bits can only be safely written when clk_sync (output of MasterMux) is running at 12MHz or lower and a duty-cycle between 30/70 and 50/50 to avoid clock glitches. The MASK bit is used for inclusion/exclusion from atomic load operations. See the description of this feature in the LD register description. SSS takes precedence over SYNC_EN. Do not set SYNC_EN high with SSS low when the divider is dividing by 1, this halts BUSCLK and is non-recoverable. BUSCLK is phase-aligned (balanced) with the ACLKs/DCLKs only when SSS or SYNC_EN is set HIGH.

Bits	Name	Description
7	MASK	Mask bits to enable shadow loads--0 disable, 1 enable. See LD register description.
6	SSS	Sync source same as output frequency. Used to bypass synchronization with delay matched path. Set this bit high when not dividing and balanced system clocks are desired. Only change when clk_sync is below 12MHz to avoid clock glitches.
		See Table 1-10.
4	DUTY	Force duty cycle to 50%. Only change this bit when divider is not in use to avoid clock glitches.
		See Table 1-9.
3	SYNC	Select output synchronization to master clock. Use to balance system clocks only when the divider is dividing by 2 or higher. Do not set this bit high when the divider is set to divide by 1 if SSS is low - this will halt BUSCLK. Otherwise, to avoid clock glitches, first set the SSS bit high when making changes, then set the SSS bit low when changes are complete. (SSS takes precedence over SYNC so doing this will protect the clock from any glitches related to changing SYNC).
		See Table 1-11.

Table 1-9. Bit field encoding: DUTY_ENUM

Value	Name	Description
1'b0	DISABLE	Disable 50% duty cycle. Pulse train.
1'b1	ENABLE	Enable 50% duty cycle clock output

Table 1-10. Bit field encoding: SSS_ENUM

Value	Name	Description
1'b0	DISABLE	Sync source not same frequency
1'b1	ENABLE	Sync source is same frequency

Table 1-11. Bit field encoding: SYNC_ENUM

Value	Name	Description

1.3.22 **CLKDIST_BCFG2** (continued)

Table 1-11. Bit field encoding: SYNC_ENUM

1'b0	DISABLE	Disable synchronization
1'b1	ENABLE	Enable synchronization

1.3.23 CLKDIST_UCFG

USB Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_UCFG: 0x40004009

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:00	
HW Access	NA			R	R	R	R	
Retention	NA			RET	RET	RET	RET	
Name	RSVD			TMODE	GPIPE	DIV2	SRC_SEL	

This register holds the USB clock configuration parameters. Only change values in this register when the USB clock is disabled to avoid clock glitches.

Bits	Name	Description
4	TMODE	Enable monitoring of clk_usb through DSI routing
		See Table 1-15.
3	GPIPE	Global DSI input pipeline configuration
		See Table 1-12.
2	DIV2	USB clock divide source by two
		See Table 1-13.
1:0	SRC_SEL[1:0]	USB clock source selection.
		See Table 1-14.

Table 1-12. Bit field encoding: CDSI_ENUM

Value	Name	Description
1'b0	BYPASS	Bypass pipeline stages
1'b1	ENABLE	Use pipeline stages

Table 1-13. Bit field encoding: DIV2_ENUM

Value	Name	Description
1'b0	DISABLE	Disable divide by two
1'b1	ENABLE	Enable divide by two

Table 1-14. Bit field encoding: SRC_SEL_ENUM

Value	Name	Description
2'h0	IMO2X	imo2x output is selected
2'h1	IMO	imo output is selected
2'h2	PLL	pll output is selected
2'h3	DSI	dsi_glb_div output is selected

Table 1-15. Bit field encoding: TMODE_ENUM

Value	Name	Description
1'b0	DISABLE	Disable clk_usb_test output to DSI
1'b1	ENABLE	Enable clk_usb_test output to DSI

1.3.24   CLKDIST_DLY0

Delay block Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_DLY0: 0x4000400A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:00		R/W:00000				
HW Access	NA	R		R				
Retention	NA	RET		RET				
Name	RSVD	CTRIM		FTRIM				

This register is used to trim the delay cell tap duration. This register should only be used when the delay cell is in trim mode (see DLY1 MODE bit). This register can also be accessed via it's alias, the DLY register in the MFGCFG address space.

Bits	Name	Description
6:5	CTRIM[1:0]	Course trim bits for delay block
		See Table 1-16.
4:0	FTRIM[4:0]	Fine trim bits for delay block
		5'b00000 Lowest bias
		... ...
		5'bfffff Highest bias

Table 1-16. Bit field encoding: CTRIM_ENUM

Value	Name	Description
2'b00	ZERO	Highest bias setting
2'b10	TWO	Second highest bias setting
2'b01	ONE	Third highest bias setting
2'b11	THREE	Fourth highest bias setting

1.3.25 CLKDIST_DLY1

Delay block Configuration Register

Reset: Reset Signals Listed Below

Register : Address

CLKDIST_DLY1: 0x4000400B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					NONRET	NA	RET
Name	RSVD					EN	RSVD	MODE

This register holds the configuration control for the clock delay cell. This cell is used to program delays between the system bus clock and each of the 4 individual analog clocks (ACLK). This is used to unalign analog and digital domain clock edges to reduce noise when the analog domain clocks. Normally the 5 domains are phase aligned for applications that need clock-edge-aligned interfaces. If clock-edge-aligned interfaces aren't needed and system noise is an issue, clock tree domains can be programmably skewed away from each other.

Bits	Name	Description
2	EN	The clk_sync_d reference clock is sourced by the clk0 output of the delay cell. This output can either be sourced from a 10-tap delay element or muxed directly (bypassed) from the delay cell's clock input (clk_sync). When bypassed (EN=0), the bus clock and all 4 analog clocks (clk_a[]) are balanced (clock-edge-aligned) if their skew delay registers are programmed to 0x0001. (see CLKDIST_ACFGx_CFG3) If EN=1 this enables the delay element on clk0 and allows the system to program delays on clk_sync_d. The delay amount is identical to the ACLK channels but is not controlled with a register, but rather with customer controlled non-volatile bits that are loaded at system POR. In this mode the clk0 has a inherent ~4ns delay, meaning BUSCLK lags the 4 ACLKs by ~4ns when all tap are programmed to 0x0001. Thus, any values programmed into the PHASE_DLY fields of the CLKDIST_ACFGx_CFG3 registers will skew the clocks relative to this ~4ns skew, as will changing the clk0 delay via CNVL setting. Note that it is not allowed that the system be configured such that clk_sync_d lag any clk_a[] by less than ~4ns for any values of the programmable delay values. The HW will fail in these cases and SW should avoid doing this. See ACFG3 register description for further details. This bit is cleared on wakeup from low power modes(sleep, hibernate, hibernate timer modes), user is expected to configure this bit to the required state. User must set the register bit PM_ACT_CFG0[7] to generate the delayed version of the clock.
0	MODE	Clock mode. Used to put the delay cell in normal more or trim mode.
		See Table 1-18.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	MODE, ISEL
Domain reset for non-retention flops [reset_all_nonretention]	EN

Table 1-17. Bit field encoding: ISEL_ENUM

Value	Name	Description
1'b0	BANDGAP	Use bandgap reference
1'b1	INTERNAL	Use internal reference, this selection is for engineering purposes only

1.3.25   **CLKDIST_DLY1** (continued)

Table 1-18. Bit field encoding: MODE_ENUM

Value	Name	Description
1'b0	DELAY	Puts the cell in normal clock delay mode. This is mission mode and allows for programming of delays on the clock trees. See CLKDIST_ACFGx_CFG3
1'b1	RING	This mode is used only for trimming. While in this mode the output of a ring oscillator is monitored and tuned to 40MHz.

1.3.26   CLKDIST_DMASK

Digital Clock Mask Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_DMASK: 0x40004010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DMASK							

Mask picking which digital clocks are enabled for shadow loads. See LD register description for usage information.

Bits	Name	Description
7:0	DMASK[7:0]	Mask bits to enable shadow loads -- 0 = Disabled, 1 = Enabled MSK0 = DCLK0 MSK1 = DCLK1 : MSK7 = DCLK7

1.3.27   CLKDIST_AMASK

Analog Clock Mask Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_AMASK: 0x40004014

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				AMASK			

Mask picking which analog clocks are enabled for shadow loads. See LD register description for usage information.

Bits	Name	Description
3:0	AMASK[3:0]	Mask bits to enable shadow loads -- 0 = Disabled, 1 = Enabled MSK0 = ACLK0 : MSK3 = ACLK3

1.3.28   CLKDIST_DCFG[0..7]_CFG0

LSB Divider Value Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_DCFG0_CFG0: 0x40004080

CLKDIST_DCFG1_CFG0: 0x40004084

Retention	RET	RET	RET	RET	RET	RET		
Name	PIPE	SSS	EARLY	DUTY	SYNC	SRC_SEL		

This register holds the 8-bit DCLK configuraton values. Only change these values when the associated clock is disabled to avoid clock glitches (See LD register for details). Clock is phase-aligned with BUSCLK only when clk_sync_d is the source and SSS or SYNC_EN are set HIGH. SSS takes presedence over SYNC_EN. Never set SYNC_EN=1 when dividing by 1, this halts the clock.

Bits	Name	Description
7	PIPE	DSI input pipeline configuration
		See Table 1-21.
6	SSS	Sync source same as output frequency. Used to bypass synchronization with delay matched path.
		See Table 1-23.
5	EARLY	This bit in the configuration register can be used to set the early phase mode, with rising edge near the half-count of the divider.
		See Table 1-20.
4	DUTY	Force duty cycle to 50%
		See Table 1-19.
3	SYNC	Select output synchronization to master clock
		See Table 1-24.
2:0	SRC_SEL[2:0]	Clock source selection.
		See Table 1-22.

1.3.34 CLKDIST_ACFG[0..3]_CFG3

Analog clocks Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CLKDIST_ACFG0_CFG3: 0x40004103

CLKDIST_ACFG1_CFG3: 0x40004107

CLKDIST_ACFG2_CFG3: 0x4000410B

CLKDIST_ACFG3_CFG3: 0x4000410F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				PHASE_DLY			

This register holds the analog clocks delay configuration. This register should not be written when the associated clock tree is enabled to avoid clock glitches. See DLY1 for more information how to use this register. Note that due to a clock balancing problem in the HW that some delay values can produce jitter in the ACLKs. For details see TFC-358.

Bits	Name	Description
3:0	PHASE_DLY[3:0]	Phase delay selection (1.0ns increments): 0x00 Clock Disabled 0x01 0 ns delay 0x02 1 ns delay ... 0x0a 9 ns delay 0x0b 10 ns delay 0x0c Clock Disabled 0x0d Clock Disabled 0x0e Clock Disabled 0x0f Clock Disabled

1.3.35   FASTCLK_IMO_CR

Internal Main Oscillator Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_IMO_CR: 0x40004200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	R	R	R	R	R	R		
Retention	RET	RET	RET	RET	RET	RET		
Name	sel_fast_bias	usbclk_on	xclken	f2xon	en_fast_bias	f_range		

This register controls operation of the IMO.

Bits	Name	Description
7	sel_fast_bias	Select IMO reference source, possible frequency selections are 12,24 and 48MHz
		See Table 1-34.
6	usbclk_on	Configures IMO for higher precision for when the internal USB clock-locking function is being used.
		See Table 1-35.
5	xclken	External clock enable for the IMO and the IMO doubler. This bit selects if the Internal Oscillator or an external clock is the source of IMO and the input to the IMO Doubler. There are two choices for the external clock source, dsi and XTAL (see CLKDIST.CR.IMO2X_SRC).
		See Table 1-36.
4	f2xon	IMO Doubler enable
		See Table 1-32.
3	en_fast_bias	Enables fast wake bias circuitry. This must be set before selecting the fast wake bias as the IMO reference using sel_fast_bias.
		See Table 1-31.
2:0	f_range[2:0]	Frequency range setting for the IMO. Note that if sel_fast_bias and en_fast_bias are set OR the device is in boot OR wake from sleep/hibernate/hibernate-timer modes IMO will be forced to FIMO mode. During boot, device wakeup from sleep/hibernate/hibernate-timers mode frequency setting is overriden by the value in PWRSYS_WAKE_TR1.wake_imofreq. During other times if sel_fast_bias and en_fast_bias are set then IMO frequency setting is controlled by f_range configuration bits only. See PWRSYS_WAKE_TR1 for FIMO frequency table.
		See Table 1-33.

Table 1-31. Bit field encoding: EN_FAST_BIAS

Value	Name	Description
1'b0	EN_FAST_BIAS_DISABLE	Disable fast wake bias circuit
1'b1	EN_FAST_BIAS_ENABLE	Enable fast wake bias circuit

1.3.35   FASTCLK_IMO_CR (continued)

Table 1-32. Bit field encoding: F2XON_ENUM

Value	Name	Description
1'b0	F2XON_0	Doubler disabled (IMOCLK2X = 0)
1'b1	F2XON_1	Doubler enabled. Note: input freq range limited to 24 MHz max.

Table 1-33. Bit field encoding: F_RANGE_ENUM

Value	Name	Description
3'h0	F_RANGE_0	12 MHz (normal)
3'h1	F_RANGE_1	6 MHz (12MHz if sel_fast_bias=1)
3'h2	F_RANGE_2	24 MHz
3'h3	F_RANGE_3	3 MHz (RESERVED in FIMO mode)
3'h4	F_RANGE_4	48 MHz
3'h5	F_RANGE_5	62 MHz center, 67 MHz peak (48MHz if sel_fast_bias=1)
3'h6	F_RANGE_6	72 MHz center, 80 Mhz peak (48MHz if sel_fast_bias=1)
3'h7	F_RANGE_7	Reserved (48MHz if sel_fast_bias=1)

Table 1-34. Bit field encoding: SEL_FAST_BIAS_ENUM

Value	Name	Description
1'b0	SEL_FAST_BIAS_NOR MAL	Select LVBG as IMO reference
1'b1	SEL_FAST_BIAS_FAST	Select fast wake bias as IMO reference

Table 1-35. Bit field encoding: USBCLK_ON_ENUM

Value	Name	Description
1'b0	USBCLK_ON_0	Normally used for non-USB modes, for lower IMO power
1'b1	USBCLK_ON_1	USB clock-locking used; IMO runs at higher power for highest USB clock precision.

Table 1-36. Bit field encoding: XCLKEN_ENUM

Value	Name	Description
1'b0	XCLKEN_0	IMO doubler runs from the IMOCLK
1'b1	XCLKEN_1	IMO doubler runs from the selected 'external' clock.

1.3.36   FASTCLK_XMHZ_CSR

External 4-25 MHz Crystal Oscillator Status and Control Register

Reset: Reset Signals Listed Below

Register : Address

FASTCLK_XMHZ_CSR: 0x40004210

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	RC:0	R/W:0	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	W	R	NA	R	R	R	R	R
Retention	NONRET	RET	NA	RET	RET	RET	RET	RET
Name	xerr	xprot	RSVD	xstart	xpump_dis	xfb_dis	xto_dis	en

This register is used to enable and configure modes of the XMHZ oscillator, and to read error status. In the table above, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
7	xerr	High output indicates oscillator failure. Only use this after start-up interval is completed. This can be used for status and failure recovery.
6	xprot	Enable External Crystal Oscillator (XMHZ) fault recovery circuitry See Table 1-39.
4	xstart	This INTERNAL bit selects the start-up mode for the oscillator. By default, the output is pulsed to initiate start-up. If a system clock is available at approximately the same frequency as the crystal, this signal can be selected to provide a faster start-up time. See Table 1-41.
3	xpump_dis	This bit disables the crystal oscillator voltage pumps. Recommended settings: 1 when VDDA > 2*VCCD (pump disabled) 0 when VDDA <= 2*VCCD (pump enabled) See Table 1-40.
2	xfb_dis	This bit disables an amplitude monitor on the oscillator signal. If the oscillator amplitude is too low, the XERR bit will be high. See Table 1-38.
1	xto_dis	This bit disables a watchdog monitor on the oscillator signal. Error output bit is asserted immediately after the oscillator is enabled and is de-asserted as soon as the output clock toggles See Table 1-42.
0	en	This bit enables the 4 - 25 MHz crystal oscillator circuit when set high. See Table 1-37.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	en, xto_dis, xfb_dis, xpump_dis, xstart, xprot
Domain reset for non-retention flops [reset_all_nonretention]	xerr

1.3.36   FASTCLK_XMHZ_CSR (continued)

Table 1-37. Bit field encoding: EN_ENUM

Value	Name	Description
1'b0	EN_0	disabled
1'b1	EN_1	enabled. Note that the oscillator amplitude takes time to reach stable amplitude. This can be monitored with the XERR bit.

Table 1-38. Bit field encoding: XFB_DIS_ENUM

Value	Name	Description
1'b0	XFB_DIS_0	Feedback enabled - If oscillator has insufficient amplitude, XERR bit will be high.
1'b1	XFB_DIS_1	Feedback disabled

Table 1-39. Bit field encoding: XPROT_ENUM

Value	Name	Description
1'b0	XPROT_0	Fault Recovery not enabled
1'b1	XPROT_1	Fault Recovery enabled

Table 1-40. Bit field encoding: XPUMP_DIS_ENUM

Value	Name	Description
1'b0	XPUMP_DIS_0	Pumps enabled - Use this setting if Vdd can be <3V.
1'b1	XPUMP_DIS_1	Pumps disabled - Only use this if Vdd will be >3V when oscillator is enabled.

Table 1-41. Bit field encoding: XSTART_ENUM

Value	Name	Description
1'b0	XSTART_0	Use internal single pulse
1'b1	XSTART_1	Use a clock close to the target frequency to improve start-up time.

Table 1-42. Bit field encoding: XTO_DIS_ENUM

Value	Name	Description
1'b0	XTO_DIS_0	Watchdog enabled - Oscillator must achieve proper switching within the internal time window, or XERR will be set high.
1'b1	XTO_DIS_1	Watchdog disabled

1.3.37   FASTCLK_XMHZ_CFG0

External 4-25 MHz Crystal Oscillator Configuration Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_XMHZ_CFG0: 0x40004212

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R/W				
Retention	NA			RET				
Name	RSVD			xcfg				

Bits	Name	Description
4:0	xcfg[4:0]	Selects amplifier transconductance setting, which impacts -R for crystal oscillator startup; Settings are based on the external crystal's parallel resonant load capacitance specification (CL) and its shunt capacitance (C0); CL >= 15pF: C0 >= 3.5pF: Frequency <= 7.3MHz : xcfg = 5'h0E 7.3MHz < Frequency <= 13.2MHz : xcfg = 5'h13 Frequency > 13.2MHz : xcfg = 5'h19 C0 < 3.5pF: Frequency <= 6.9MHz : xcfg = 5'h13 Frequency > 6.9MHz : xcfg = 5'h17 CL < 15pF: Frequency <= 7.3MHz : xcfg = 5'h0A 7.3MHz < Frequency <= 12.9MHz : xcfg = 5'h0E Frequency > 12.9MHz : xcfg = 5'h13

1.3.38   FASTCLK_XMHZ_CFG1

External 4-25 MHz Crystal Oscillator Configuration Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_XMHZ_CFG1: 0x40004213

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			R/W:0000			
HW Access	NA	R/W			R/W			
Retention	NA	RET			RET			
Name	RSVD	vref_sel_wd			vref_sel_fb			

Bits	Name	Description
6:4	vref_sel_wd[2:0]	Selects reference level for watchdog (vrefout_wd); NOTE: vref_sel_fb must be greater than or equal to the binary value of vref_sel_wd. Valid settings are: 5 for XOSC freq < 16 MHz 3 for 16 MHz <= XOSC freq <= 25 MHz See Table 1-44.
3:0	vref_sel_fb[3:0]	Selects reference level for feedback (vrefout_fb); NOTE: vref_sel_fb must be greater than or equal to the binary value of vref_sel_wd See Table 1-43.

Table 1-43. Bit field encoding: VREF_SEL_FB_ENUM

Value	Name	Description
4'h0	VREF_SEL_FB_0	139 mV
4'h1	VREF_SEL_FB_1	185 mV
4'h2	VREF_SEL_FB_2	231 mV
4'h3	VREF_SEL_FB_3	277 mV
4'h4	VREF_SEL_FB_4	323 mV
4'h5	VREF_SEL_FB_5	370 mV
4'h6	VREF_SEL_FB_6	416 mV
4'h7	VREF_SEL_FB_7	462 mV
4'h8	VREF_SEL_FB_8	508 mV
4'h9	VREF_SEL_FB_9	554 mV
4'ha	VREF_SEL_FB_10	601 mV
4'hb	VREF_SEL_FB_11	647 mV
4'hc	VREF_SEL_FB_12	693 mV
4'hd	VREF_SEL_FB_13	739 mV
4'he	VREF_SEL_FB_14	786 mV
4'hf	VREF_SEL_FB_15	832 mV

Table 1-44. Bit field encoding: VREF_SEL_WD_ENUM

Value	Name	Description
3'h0	VREF_SEL_WD_0	46 mV
3'h1	VREF_SEL_WD_1	92 mV
3'h2	VREF_SEL_WD_2	139 mV
3'h3	VREF_SEL_WD_3	185 mV
3'h4	VREF_SEL_WD_4	231 mV

1.3.38   **FASTCLK_XMHZ_CFG1** (continued)

Table 1-44. Bit field encoding: VREF_SEL_WD_ENUM

3'h5	VREF_SEL_WD_5	277 mV
3'h6	VREF_SEL_WD_6	323 mV
3'h7	VREF_SEL_WD_7	370 mV

1.3.39   FASTCLK_PLL_CFG0

PLL Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_PLL_CFG0: 0x40004220

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01		R/W:01		NA:000			R/W:0
HW Access	R		R		NA			R
Retention	RET		RET		NA			RET
Name	wait		delay		RSVD			en

This register provides status and control for the PLL.

Bits	Name	Description
7:6	wait[1:0]	Lock detect wait time before declaring lock. The PLL's high phase error indicator must remain low for this number of PFD clock periods before the raw lock detect signal asserts. The PFD clock must be within 1MHz to 3MHz, and is determined by the PLL reference clock (FREF) divided by Q. The PFD clock period TPFD is determined by the equation TPFD=Q/FREF
		See Table 1-47.
5:4	delay[1:0]	Lock detect delay time. This is approximate phase error time allowed before the high phase error indicator asserts and clears the raw lock detect status bit.
		See Table 1-45.
0	en	Enable PLL
		See Table 1-46.

Table 1-45. Bit field encoding: DELAY_ENUM

Value	Name	Description
2'h0	DELAY_0	19ns delay
2'h1	DELAY_1	23ns delay (default)
2'h2	DELAY_2	28ns delay
2'h3	DELAY_3	33ns delay

Table 1-46. Bit field encoding: PLL_EN_ENUM

Value	Name	Description
1'b0	PLL_EN_DISABLE	PLL Disabled
1'b1	PLL_EN_ENABLE	PLL Enabled

Table 1-47. Bit field encoding: WAIT_ENUM

Value	Name	Description
2'h0	WAIT_0	7 * TPFD
2'h1	WAIT_1	15 * TPFD (default)
2'h2	WAIT_2	23 * TPFD
2'h3	WAIT_3	31 * TPFD

1.3.40 FASTCLK_PLL_CFG1

PLL Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_PLL_CFG1: 0x40004221

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:100			NA:00		R/W:10	
HW Access	NA	R			NA		R	
Retention	NA	RET			NA		RET	
Name	RSVD	icpsel			RSVD		vco_gain	

This register sets trim levels and test modes in the PLL.

Bits	Name	Description
6:4	icpsel[2:0]	Charge Pump current select. This bit-field should be set to 0x01 for all configurations. See Table 1-48.
1:0	vco_gain[1:0]	VCO loop gain. Gain doesn't begin effect the VCO frequency characteristics untill freq>60MHz. Effect of gain setting is provided at 25C, Vctrl=0.925V. See Table 1-49.

Table 1-48. Bit field encoding: PLL_ICPSEL_ENUM

Value	Name	Description
3'h0	PLL_ICPSEL_0	1uA
3'h1	PLL_ICPSEL_1	2uA
3'h2	PLL_ICPSEL_2	3uA
3'h3	PLL_ICPSEL_3	4uA
3'h4	PLL_ICPSEL_4	5uA
3'h5	PLL_ICPSEL_5	6uA
3'h6	PLL_ICPSEL_6	7uA
3'h7	PLL_ICPSEL_7	1uA

Table 1-49. Bit field encoding: PLL_VCO_GAIN_ENUM

Value	Name	Description
2'h0	PLL_VCO_GAIN_0	RESERVED
2'h1	PLL_VCO_GAIN_1	RESERVED
2'h2	PLL_VCO_GAIN_2	456 MHz/V
2'h3	PLL_VCO_GAIN_3	RESERVED

1.3.41   FASTCLK_PLL_P

PLL P-Counter Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_PLL_P: 0x40004222

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000100							
HW Access	R							
Retention	RET							
Name	p							

This register sets the P-Counter value, an 8-bit feedback divider

Bits	Name	Description
7:0	p[7:0]	P-Counter divide value. Settings less than 8 do not give valid outputs. Valid range is 8 - 255, but this must still give a divided frequency of 1 - 3 MHz (PLLOUT / P); this is the limit of the implementation. Set the P-Counter to legal value before enabling PLL. f_out = f_in*(P/Q) See Table 1-50.

Table 1-50. Bit field encoding: P_ENUM

Value	Name	Description
8'h08	P_DIV8	Divide by 8 (minimum valid value)
8'h09	P_DIV9	Divide by 9
8'h0A	P_DIV10	Divide by 10
8'h0f	P_DIV15	Divide by 15
8'hfe	P_DIV254	Divide by 254
8'hff	P_DIV255	Divide by 255

1.3.42 FASTCLK_PLL_Q

PLL Q-Counter Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FASTCLK_PLL_Q: 0x40004223

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0011			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				q			

This register sets the Q-Counter value, a 4-bit divider on the input clock to the PLL.

Bits	Name	Description
3:0	q[3:0]	Q-Counter divide value. qrt-The Q divider (Reference) input Freq range is: 1-48MHz. The Q divider output Freq (and PFD input Freq) must be between 1-3MHz. $f\_out = f\_in*(P/Q)$ See Table 1-51.

Table 1-51. Bit field encoding: Q_ENUM

Value	Name	Description
4'h0	Q_DIV1	Divide by 1
4'h1	Q_DIV2	Divide by 2
4'h2	Q_DIV3	Divide by 3
4'h3	Q_DIV4	Divide by 4
4'h4	Q_DIV5	Divide by 5
4'h5	Q_DIV6	Divide by 6
4'h6	Q_DIV7	Divide by 7
4'h7	Q_DIV8	Divide by 8
4'h8	Q_DIV9	Divide by 9
4'h9	Q_DIV10	Divide by 10
4'ha	Q_DIV11	Divide by 11
4'hb	Q_DIV12	Divide by 12
4'hc	Q_DIV13	Divide by 13
4'hd	Q_DIV14	Divide by 14
4'he	Q_DIV15	Divide by 15
4'hf	Q_DIV16	Divide by 16

1.3.43   FASTCLK_PLL_SR

PLL Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

FASTCLK_PLL_SR: 0x40004225

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						NA:0	RC:0
HW Access	NA						NA	W
Retention	NA						NA	NONRET
Name	RSVD						RSVD	lockdet

Bits	Name	Description
0	lockdet	Lock Status Flag. If lock is acquired this flag will stay set (regardless of whether lock is subsequently lost) until it is read. Upon reading it will clear. If lock is still true then the bit will simply set again. If lock happens to be false when the clear on read occurs then the bit will stay cleared until the next lock event. This output is only valid if the PLL is enabled. If the PLL is disabled, this bit may be high and won't be cleared by a read. In this scenario, this bit will remain high after enabling the PLL until after the PLL clock output begins running. As a safeguard, the lock bit should not be polled for 50us after the PLL is enabled. The bit should be ignored altogether when the PLL is disabled.

1.3.44   SLOWCLK_ILO_CR0

Internal Low-speed Oscillator Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SLOWCLK_ILO_CR0: 0x40004300

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:1	NA:0	R/W:1	R/W:1	NA:0
HW Access	NA		R	R	NA	R	R	NA
Retention	NA		RET	RET	NA	RET	RET	NA
Name	RSVD		div3en	pd_mode	RSVD	en_100k	en_1k	RSVD

This register controls operation of the ILO output clocks.

Bits	Name	Description
5	div3en	Divide-by-3 enable for 100 kHz output
		See Table 1-52.
4	pd_mode	Power down mode for ILO
		See Table 1-53.
2	en_100k	Enables 100kHz ILO clock output when set. When clear, clock output is low.
1	en_1k	Enables 1kHz ILO clock output when set. This bit is forced on when PM.WDT_CFG.wdr_en bit is set. When clear, clock output is low.

Table 1-52. Bit field encoding: DIV3EN_ENUM

Value	Name	Description
1'b0	DIV3EN_0	CLK33K disabled
1'b1	DIV3EN_1	CLK33K enabled, divides CLK100K by 3

Table 1-53. Bit field encoding: PD_MODE_ENUM

Value	Name	Description
1'b0	PD_MODE_0	Faster start-up, internal bias left on
1'b1	PD_MODE_1	Slower start-up, internal bias off

1.3.45   SLOWCLK_ILO_CR1

Internal Low-speed Oscillator Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SLOWCLK_ILO_CR1: 0x40004301

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R/W	R	R
Retention	NA					RET	RET	RET
Name	RSVD					freq_sel	bias_opt	dis_turbo

This register controls non-standard features of the ILO.

Bits	Name	Description
2	freq_sel	Frequency select for CLK100K
		See Table 1-56.
1	bias_opt	Alternate bias for ILO
		See Table 1-54.
0	dis_turbo	Start-up speed control
		See Table 1-55.

Table 1-54. Bit field encoding: BIAS_OPT_ENUM

Value	Name	Description
1'b0	BIAS_OPT_0	sub-threshold bias (default)
1'b1	BIAS_OPT_1	Use saturated bias

Table 1-55. Bit field encoding: DIS_TURBO_ENUM

Value	Name	Description
1'b0	DIS_TURBO_0	Turbo enabled (recommended)
1'b1	DIS_TURBO_1	Turbo disabled

Table 1-56. Bit field encoding: FREQ_SEL_ENUM

Value	Name	Description
1'b0	FREQ_SEL_0	CLK100K defaults to 100 kHz
1'b1	FREQ_SEL_1	CLK100K defaults to 32 kHz

1.3.46   SLOWCLK_X32_CR

External 32kHz Crystal Oscillator Control Register

Reset: Reset Signals Listed Below

Register : Address

SLOWCLK_X32_CR: 0x40004308

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:U	R:U	NA:0	R/W:1	R/W:0	R/W:0
HW Access	NA		W	W	NA	R	R	R
Retention	NA		NONRET	NONRET	NA	RET	RET	RET
Name	RSVD		ana_stat	dig_stat	RSVD	pdb	lpm	x32en

This register controls operation of the 32K Crystal Oscillator, and provides status on the oscillator's stability.

Bits	Name	Description
5	ana_stat	Indicates oscillator status, using internal analog measurement. See Table 1-57.
4	dig_stat	Indicates oscillator status, using test against a reference clock. The ILO's CLK33K must be enabled for this function to operate. See Table 1-58.
2	pdb	Power switch enable (active-low powerdown) for 32K crystal oscillator. When enabling the X32, it is recommended to set this bit first, then set en=1 in a separate bus cycle. The X32 is automatically powered down during hibernate modes.
1	lpm	Power setting for 32K crystal oscillator. This setting only takes effect in sleep modes. During active modes, the oscillator always runs in high power mode. See Table 1-59.
0	x32en	32K Crystal Oscillator Enable See Table 1-60.

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	dig_stat, ana_stat
System reset for always on flops [reset_all_alwayson]	x32en, lpm, pdb

Table 1-57. Bit field encoding: ANA_STAT_ENUM

Value	Name	Description
1'b0	ANA_STAT_0	oscillator not stable
1'b1	ANA_STAT_1	oscillator stable

Table 1-58. Bit field encoding: DIG_STAT_ENUM

Value	Name	Description
1'b0	DIG_STAT_0	oscillator not stable
1'b1	DIG_STAT_1	oscillator stable

1.3.46   SLOWCLK_X32_CR (continued)

Table 1-59. Bit field encoding: LPM_ENUM

Value	Name	Description
1'b0	LPM_0	High Power Mode
1'b1	LPM_1	Low Power Mode (Only applies in chip sleep mode)

Table 1-60. Bit field encoding: X32EN_ENUM

Value	Name	Description
1'b0	X32_EN_0	Oscillator disabled, power down
1'b1	X32_EN_1	Oscillator enabled

1.3.47 SLOWCLK_X32_CFG

External 32kHz Crystal Oscillator Configuration Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

SLOWCLK_X32_CFG: 0x40004309

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:000			R/W:01		R/W:0	R/W:0
HW Access	R	NA			R		R	R
Retention	RET	NA			RET		RET	RET
Name	lp_allow	RSVD			lp		test	xrefclk

This register provides options for configuring the 32kHz Crystal Oscillator block. These options are normally only used for testing or factory calibration.

Bits	Name	Description
7	lp_allow	Low power oscillator mode configuration.
		See Table 1-63.
3:2	lp[1:0]	GM Setting for LPM=1.
		See Table 1-61.
1	test	Enables a test mode to bring the internal current reference out.
		See Table 1-62.
0	xrefclk	Allows external clock to be driving into the crystal oscillator input, normally for test.
		See Table 1-64.

Table 1-61. Bit field encoding: LP_ENUM

Value	Name	Description
2'b00	LP_MIN	Lowest power setting
2'b01	LP_LOW	Default setting, Low Power setting
2'b10	LP_MED	Medium power setting
2'b11	LP_MAX	Highest power setting

Table 1-62. Bit field encoding: TEST_ENUM

Value	Name	Description
1'b0	TEST_0	Normal operation
1'b1	TEST_1	Enables ref current x1000 to come to a pad for test

Table 1-63. Bit field encoding: X32_CFG_ENUM

Value	Name	Description
1'b0	LP_OFF	Low power oscillator mode allowed only in sleep mode.
1'b1	LP_ON	Low power oscillator mode allowed in active mode.

Table 1-64. Bit field encoding: XREFCLK_ENUM

Value	Name	Description
1'b0	XREFCLK_0	Normal operation
1'b1	XREFCLK_1	Signal at crystal input assumed to be a clock, which is driven to the crystal output pad and to the internal CLK32K

1.3.48 SLOWCLK_X32_TST

External 32kHz Crystal Oscillator Test Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

SLOWCLK_X32_TST: 0x4000430A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01011111							
HW Access	R							
Retention	RET							
Name	test							

This register provides for DFT options for the 32kHz external crystal oscillator block.

Bits	Name	Description
7:0	test[7:0]	Test bits -- leave high for normal operation

1.3.49   BOOST_CR0

Boost Control 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BOOST_CR0: 0x40004320

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:11		R/W:00100				
HW Access	R/W	R/W		R/W				
Retention	RET	RET		RET				
Name	thump	mode		vsel				

Boost output voltage and mode control register.

Bits	Name	Description
7	thump	Generates a 1 microsecond pulse on 0->1 transition. Must be cleared by firmware before another pulse can be generated. Used for discrete switch control in Boost Standby Mode.
6:5	mode[1:0]	Boost mode select. See Table 1-65.
4:0	vsel[4:0]	Boost voltage selection See Table 1-66.

Table 1-65. Bit field encoding: mode_enum

Value	Name	Description
2'b00	MODE_00	Standby Mode (low power state)
2'b01	MODE_01	Reserved
2'b10	MODE_10	Reserved
2'b11	MODE_11	Active Mode (regulating)

Table 1-66. Bit field encoding: vsel_enum

Value	Name	Description
5'b00000	VSEL_OFF	Off (0V)
5'b00001	VSEL_0x01	Reserved
5'b00010	VSEL_0x02	Reserved
5'b00011	VSEL_1P80V	1.80V
5'b00100	VSEL_1P90V	1.90V (Power Up Setting)
5'b00101	VSEL_2P00V	2.00V
5'b00110	VSEL_2P10V	2.10V
5'b00111	VSEL_2P20V	2.20V
5'b01000	VSEL_2P30V	2.30V
5'b01001	VSEL_2P40V	2.40V
5'b01010	VSEL_2P50V	2.50V
5'b01011	VSEL_2P60V	2.60V
5'b01100	VSEL_2P70V	2.70V
5'b01101	VSEL_2P80V	2.80V
5'b01110	VSEL_2P90V	2.90V
5'b01111	VSEL_3P00V	3.00V
5'b10000	VSEL_3P10V	3.10V
5'b10001	VSEL_3P20V	3.20V
5'b10010	VSEL_3P30V	3.30V

1.3.49 BOOST_CR0 (continued)

Table 1-66. Bit field encoding: vsel_enum

5'b10011	VSEL_3P40V	3.40V
5'b10100	VSEL_3P50V	3.50V
5'b10101	VSEL_3P60V	3.60V
5'b10110	VSEL_4P00V	4.00V
5'b10111	VSEL_4P25V	4.25V
5'b11000	VSEL_4P50V	4.50V
5'b11001	VSEL_4P75V	4.75V
5'b11010	VSEL_5P00V	5.00V
5'b11011	VSEL_0x1B	Reserved
5'b11100	VSEL_0x1C	Reserved
5'b11101	VSEL_0x1D	Reserved
5'b11110	VSEL_0x1E	Reserved
5'b11111	VSEL_0x1F	Reserved

1.3.50   BOOST_CR1

Boost Control 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BOOST_CR1: 0x40004321

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	NA:0	NA:0	NA:0	R/W:1	NA:0	R/W:01	
HW Access	NA	NA	NA	NA	R/W	NA	R/W	
Retention	NA	NA	NA	NA	RET	NA	RET	
Name	RSVD	RSVD	RSVD	RSVD	boosten	RSVD	clk	

Boost test, clock, and mode control register.

Bits	Name	Description
3	boosten	When set, enables boost operation. For PSoC5 devices to wake-up from low power modes due to a boost under voltage event, the BOOST_CR4[0] boost_ie bit must be set.
1:0	clk[1:0]	Boost active mode internal PWM clock frequency selection
		See Table 1-67.

Table 1-67. Bit field encoding: clk_enum

Value	Name	Description
2'b00	CLK_RSVD0	Reserved
2'b01	CLK_ON	PWM Clock On at 400kHz. Use this setting in Boost Active Mode. PWM is off in Boost Standby Mode.
2'b10	CLK_RSVD2	Reserved
2'b11	CLK_OFF	PWM Clock Off. Use this setting in Boost Standby Mode for lowest current, or for selecting the External Clock in Automatic Thump Mode.

1.3.51   BOOST_CR2

Boost Control 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BOOST_CR2: 0x40004322

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:1	R:0	R:0	R/W:0	R/W:0	NA:0	R/W:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	NA	R/W
Retention	RET	RET	RET	RET	RET	RET	NA	RET
Name	disc	boosting	equal	limdet	erefsel	limoff	RSVD	enatm

Boost configuration and status register. The lower 4 bits are advanced configuration and the upper 4 bits are status.

Bits	Name	Description
7	disc	When set, boost converter is operating in discontinuous mode
6	boosting	When set, converter is boosting (VBOOST < vsel)
5	equal	When set, converter is bypassed (VBAT >= vsel). VBOOST shorted to VBAT.
4	limdet	When set, the IND was not fully pulled low during the full duration that the NMOS switch to ground was enabled. This is a debug flag only. The circuit takes no action based on this status bit.
3	erefsel	When set, selects external reference See Table 1-68.
2	limoff	When set, turns off skip cycle current limiter
0	enatm	When set, enables Automatic Thump Mode in Boost Standby Mode

Table 1-68. Bit field encoding: BOOST_EREFSEL_ENUM

Value	Name	Description
1'b0	BOOST_EREFSEL_INTERNAL	Select internal reference
1'b1	BOOST_EREFSEL_EXTERNAL	Select external 800mv precision reference (vref_800mv)

1.3.52   BOOST_CR3

Boost Control 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BOOST_CR3: 0x40004323

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R/W	
Retention	NA						RET	
Name	RSVD						pwm	

Boost PWM value (not written during normal operation).

Bits	Name	Description
1:0	pwm[1:0]	Current state of the internal pulse width modulator. The PWM value should not be written during normal operation - it should be treated as read-only. 2'h3 means maximum duty cycle. 2'h0 means minimum duty cycle.

1.3.53   BOOST_SR

Boost Status

Reset: N/A

Register : Address

BOOST_SR: 0x40004324

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:U	R:U	NA:0	R:U	R:U	R:U	R:U	R:U
HW Access	R/W	R/W	NA	R/W	R/W	R/W	R/W	R/W
Retention	RET	RET	NA	RET	RET	RET	RET	RET
Name	ready	start	RSVD	ov	vhi	vnom	vlo	uv

Boost status, including window comparator results.

Bits	Name	Description
7	ready	When set, internal circuits have been initialized
6	start	When set, converter is in startup mode
4	ov	Output above overvoltage limit when 1, below limit when 0
3	vhi	Output is above vhigh limit when 1, below limit when 0
2	vnom	Output is above nominal when 1, below nominal when 0
1	vlo	Output is above vlow limit when 1, below limit when 0
0	uv	Output is above undervoltage limit when 1, below limit when 0

1.3.54   BOOST_CR4

Boost Control Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BOOST_CR4: 0x40004325

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							boost_ie

Boost interrupt control register.

Bits	Name	Description
0	boost_ie	When set, a boost undervoltage condition is propagated to the interrupt controller via the PM interrupt line. When clear, the interrupt condition is masked.

1.3.55   BOOST_SR2

Boost Status Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BOOST_SR2: 0x40004326

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							boost_int

Boost interrupt status register.

Bits	Name	Description
0	boost_int	When set, a boost undervoltage event has occured. The setting of boost_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)

1.3.56   PWRSYS_CR0

Power System Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_CR0: 0x40004330

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:000			R/W:0
HW Access	NA		R	R	NA			R
Retention	NA		RET	RET	NA			RET
Name	RSVD		ext_vccd	ext_vcca	RSVD			rbbnw_dis

This register controls the voltage regulators.

Bits	Name	Description
5	ext_vccd	When set, the core digital (vccd) pin is driven with an externally regulated voltage. This disables the internal LDO-D regulator. If both LDO's are disabled, the BREF will be automatically disabled, too. The BREF must be manually enabled before re-enabling either LDO.
4	ext_vcca	When set, the core analog (vcca) pin is driven with an externally regulated voltage. This disables the internal LDO-A regulator. If both LDO's are disabled, the BREF will be automatically disabled, too. The BREF must be manually enabled before re-enabling either LDO.
0	rbbnw_dis	When set, disables the nwell reverse biasing during low power modes. Nwell reverse biasing is always disabled during active/standby modes.

1.3.57   PWRSYS_CR1

Power System Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_CR1: 0x40004331

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					i2creg_back up	ldoa_dis	ldoa_iso

This register controls the voltage regulators.

Bits	Name	Description
2	i2creg_backup	When set, enables the I2C regulator backup. The I2C backup regulator enables the I2C logic to wake the chip from sleep mode on an I2C address match.
1	ldoa_dis	Reserved, bit should always be set to 0 when writing register.
0	ldoa_iso	Reserved, bit should always be set to 0 when writing register.

1.3.58   PM_TW_CFG0

Timewheel Configuration Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_TW_CFG0: 0x40004380

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	\multicolumn{8}{c}{R/W:00000000}							
HW Access	R							
Retention	RET							
Name	ftw_interval							

This register controls settings for the fast timewheel. If using low power active (LPA) mode, the fast timewheel must be used to program the burst period.

Bits	Name	Description
7:0	ftw_interval[7:0]	Sets the fast timewheel interval. The fast timewheel is programmed using a 8-bit terminal count (N-1) and is clocked by the ILO at 100 kHz. When the terminal count is reached, the timewheel automatically resets and begins counting again. This value can only be changed when {PM.TW_CFG2}.ftw_en is clear. After enabling, the duration before the first event is between 1 and 2 additional cycles, depending on synchronization with the ILO clock. Additional events occur periodically with a period of (1+ftw_interval).

1.3.59   PM_TW_CFG1

Timewheel Configuration Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_TW_CFG1: 0x40004381

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1001			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				ctw_interval			

This register controls settings for the central timewheel.

Bits	Name	Description
3:0	ctw_interval[3:0]	Sets the central timewheel interval. The period is based on the ILO running at 1 kHz. When the interval is reached, it is automatically restarted. The first interval can range from 1 to (period + 1) ms. Additional intervals occur at the nominal period. This value can only be changed when {TW_CFG2}.ctw_en is clear. See Table 1-69.

Table 1-69. Bit field encoding: ctw_interval_enum

Value	Name	Description
4'b0000	CTW_1_TICK	not presently supported ==> is same as CTW_2_TICKS
4'b0001	CTW_2_TICKS	2 CTW ticks ==> 2ms (nominal)
4'b0010	CTW_4_TICKS	4 CTW ticks ==> 4ms (nominal)
4'b0011	CTW_8_TICKS	8 CTW ticks ==> 8ms (nominal)
4'b0100	CTW_16_TICKS	16 CTW ticks ==> 16ms (nominal)
4'b0101	CTW_32_TICKS	32 CTW ticks ==> 32ms (nominal)
4'b0110	CTW_64_TICKS	64 CTW ticks ==> 64ms (nominal)
4'b0111	CTW_128_TICKS	128 CTW ticks ==> 128ms (nominal)
4'b1000	CTW_256_TICKS	256 CTW ticks ==> 256ms (nominal)
4'b1001	CTW_512_TICKS	512 CTW ticks ==> 512ms (nominal)
4'b1010	CTW_1024_TICKS	1024 CTW ticks ==> 1024ms (nominal)
4'b1011	CTW_2048_TICKS	2048 CTW ticks ==> 2048ms (nominal)
4'b1100	CTW_4096_TICKS	4096 CTW ticks ==> 4096ms (nominal)

1.3.60   PM_TW_CFG2

Timewheel Configuration Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_TW_CFG2: 0x40004382

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA		R	R	R	R	R	R
Retention	NA		RET	RET	RET	RET	RET	RET
Name	RSVD		onepps_ie	onepps_en	ctw_ie	ctw_en	ftw_ie	ftw_en

This register controls settings for the central and fast timewheels.

Bits	Name	Description
5	onepps_ie	When set and one pulse-per-second is enabled, an interrupt is issued when the pulse occurs. If onepps_en is not enabled, no interrupt is generated.
4	onepps_en	When set, the system returns to the active global power mode once every second. The 32 kHz external crystal oscillator must be enabled to use the one pulse-per-second function. For PSoC5 devices to wake-up from low power modes with the onepps interrupt, the onepps_ie bit must be set.
3	ctw_ie	When set and the central timewheel is enabled, an interrupt is issued when the central timewheel reaches the selected interval. If ctw_en is not enabled, no interrupt is generated.
2	ctw_en	When set, the system returns to the active global power mode when the central timewheel reaches the interval selected in {PM.TW_CFG1}.ctw_interval. The ILO 1 kHz clock source must be enabled to use the central timewheel. For PSoC5 devices to wake-up from low power modes with the ctw interrupt, the ctw_ie bit must be set.
1	ftw_ie	When set and the fast timewheel is enabled, an interrupt is issued when it reaches the terminal count. If ftw_en is not enabled, no interrupt is generated. This bit is ignored when LPA is enabled, and no interrupts are issued.
0	ftw_en	When set, the system returns to the active global power mode when the fast timewheel reaches the terminal count selected in {PM.TW_CFG0}.ftw_interval. This bit should be set when using Low Power Active (lpa) mode, since the fast timewheel is usually used to control the LPA burst period. The ILO 100 kHz clock source must be enabled to use the fast timewheel.

1.3.61   PM_WDT_CFG

Watchdog Timer Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_WDT_CFG: 0x40004383

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:01		R/W:0	NA:00		R/W:01	
HW Access	R	R		R	NA		R	
Retention	RET	RET		RET	NA		RET	
Name	ctw_reset	wdt_lpmode		wdr_en	RSVD		wdt_interval	

This register controls the watchdog timer (WDT) settings.

Bits	Name	Description
7	ctw_reset	When a one is written to this field, the free-running central timewheel counter is reset to 0 and held there. Firmware must then write a zero to exit the reset state. Since the central timewheel is used for many timing tasks (including buzz timing and WDT), care must be taken when resetting it. It is generally recommended to reset it only once when the watchdog is enabled, to ensure that first watchdog period is full. Cannot be changed after the watchdog is enabled.
6:5	wdt_lpmode[1:0]	If the Watchdog-Timer (WDT) is enabled, these 2 bits are used to define how the WDT behaves when the part enters Sleep/Idle/Hibtimers (low power) mode. By default (wdt_lpmode is left 01), the system will automatically use the longest WDT interval when Sleep/Idle/Hibtimers mode is entered - so SW isn't burdened with waking just to feed the WDT. This is true regardless of the value programmed in the wdt_interval register. Upon wakeup, the interval will remain at the highest setting until the WDT is fed the first time by the user. A feeding at this point will cause the interval to automatically return to the normal setting (value in wdt_interval). If this field is set to NOCHANGE ('00'), the system does not change the interval and does not feed the WDT when entering Sleep/Idle/Hibtimers mode. If DISABLED (wdt_lpmode=11), the WDT is turned off when Sleep/Idle/Hibtimers mode is entered and remains disabled until the first feeding by the user after Active mode is reentered. This field cannot be changed once {PM.WDT_CFG}.wdr_en is set. See Table 1-71.
4	wdr_en	When set, enables the watchdog reset (WDR) using the current WDT settings. Once enabled, the WDT cannot be disabled except by a reset. Setting this bit automatically enables the ILO 1 kHz clock source.
1:0	wdt_interval[1:0]	Selects the central timewheel taps that control the WDT period. The accuracy of the intervals are dependent upon the accuracy of the oscillator used. A watchdog reset (WDR) may be issued at any time within the selected interval, so software should be programmed to service the WDT before the lower bound is reached (two tap periods). A WDR is always issued within three tap periods. Once {PM.WDT_CFG}.wdr_en is set, the watchdog interval cannot be changed. See Table 1-70.

Table 1-70. Bit field encoding: wdt_interval_enum

Value	Name	Description
2'b00	WDT_2_TICKS	2 CTW ticks ==> 4ms - 6ms
2'b01	WDT_16_TICKS	16 CTW ticks ==> 32ms - 48ms
2'b10	WDT_128_TICKS	128 CTW ticks ==> 256ms - 384ms
2'b11	WDT_1024_TICKS	1024 CTW ticks ==> 2.048s - 3.072s

1.3.61   PM_WDT_CFG (continued)

Table 1-71. Bit field encoding: wdt_lpmode_enum

Value	Name	Description
2'b00	WDT_LPMODE_NOCHANGE	WDT does not change behavior when Sleep/Idle Mode/Hibtimers is entered
2'b01	WDT_LPMODE_MAXINTER	WDT automatically switches to max interval when Sleep/Idle/Hibtimers Mode is entered
2'b10	WDT_LPMODE_RESERVED	Reserved (acts the same as NOCHANGE)
2'b11	WDT_LPMODE_DISABLED	WDT is disabled when Sleep/Idle/Hibtimers Mode is entered

1.3.62   PM_WDT_CR

Watchdog Timer Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_WDT_CR: 0x40004384

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:00000000							
HW Access	NA							
Retention	RET							
Name	wdt_clear							

This register is used to feed the watchdog timer (WDT).

Bits	Name	Description
7:0	wdt_clear[7:0]	Any write to this field feeds the WDT. After each feeding, there are at least two entire watchdog timer tap periods before a WDR occurs. Always reads as zero.

1.3.63   PM_INT_SR

Power Manager Interrupt Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_INT_SR: 0x40004390

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				RC:0	RC:0	RC:0	RC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				RET	RET	RET	RET
Name	RSVD				limact_int	onepps_int	ctw_int	ftw_int

This register indicates which interrupts occured since the last read of the register. All bits are automatically cleared on read. If an interrupt gets generated at the same time as a clear, the bit will remain set (which causes another interrupt).

Bits	Name	Description
3	limact_int	When set, a limited active ready event has occured. The setting of limact_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)
2	onepps_int	When set, a onepps event has occured. The setting of onepps_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)
1	ctw_int	When set, a central timewheel event has occured. The setting of ctw_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)
0	ftw_int	When set, a fast timewheel event has occured. The setting of ftw_ie determines whether this interrupt condition is masked or propagated to the interrupt controller. Sticky (whole field)

1.3.64   PM_MODE_CFG0

Power Mode Configuration Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_MODE_CFG0: 0x40004391

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	lpa_cycles							

This register controls settings for the low power modes.

Bits	Name	Description
7:0	lpa_cycles[7:0]	A setting of N causes (N+1) cycles to execute during each burst

1.3.65   PM_MODE_CFG1

Power Mode Configuration Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_MODE_CFG1: 0x40004392

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	R/W:0
HW Access	NA				R	NA	R	R
Retention	NA				RET	NA	RET	RET
Name	RSVD				limact_ie	RSVD	lpa_fie	lpa_en

This register controls settings for the low power modes.

Bits	Name	Description
3	limact_ie	Setting this bit will issue an interrupt when the system can return from limited active to fully active mode. To reliably generate the interrupt, this bit should be set prior to entering idle mode.
1	lpa_fie	When clear, interrupts are held off until next burst. This increases average interrupt latency, as compared to an active mode baseline design with identical throughput. When set, interrupts return the system to active mode, the on-time counter is reset, and the system will execute at least N cycles.
0	lpa_en	When set, LPA mode is enabled. LPA mode is compatible with all global power modes. If standby mode is specified, it is interpreted as an early return to standby, and the LPA scheduler will wake the system on the original schedule. If idle, sleep, or hibernate modes are specified, LPA is temporarily paused and resumed upon wakeup. Clearing this bit immediately disables LPA.

1.3.66   PM_MODE_CSR

Power Mode Control/Status Register

Reset: Reset Signals Listed Below

Register : Address

PM_MODE_CSR: 0x40004393

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WC:1	R:0	NA:0	R/WOC:0	R:1	R/W:000		
HW Access	W	W	NA	R	W	R/W		
Retention	NONRET	RET	NA	RET	RET	RET		
Name	nonret_rst	limact_mode	RSVD	reactivate	pwrup_pulse_q	lp_mode		

This register controls settings for the global power mode.

Bits	Name	Description
7	nonret_rst	Persistent status bit that indicates a non-retention reset occured for some chip registers. This bit is preset high by any chip reset, and it is cleared whenever the register is written. When the system automatically resets non-retention registers (such as when returning from low power modes or a reactivation), this field is set high to indicate some register state has changed. Sticky (whole field)
6	limact_mode	When set, the chip is in limited active mode. Some subsystems and domains are unavailable in this mode. A reactivation is required to return the chip to active mode.
4	reactivate	Setting this bit reactivates subsystems with pending availability. This is used to transition from limited active to active mode or to initiate the delayed activation procedure after change(s) to PM_AVAIL* register(s). The reactivation process simulates a transition from sleep to active mode. During the simulated transition, user clocks are stopped. After completion, the system is in active mode regardless of the LP_MODE setting. This bit always reads as zero.
3	pwrup_pulse_q	When set, indicates that the chip is internally waiting for the hibernate/sleep regulator to stabilize. The chip will ignore LP requests for idle, sleep, and hibernate modes until the regulator is stable.
2:0	lp_mode[2:0]	Sets the global power mode. See Table 1-72.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	lp_mode[2:0], pwrup_pulse_q, reactivate, test_domains, limact_mode
Domain reset for non-retention flops [reset_all_nonretention]	nonret_rst

Table 1-72. Bit field encoding: mode_enum

Value	Name	Description
3'b000	MODE_ACTIVE	Active mode
3'b001	MODE_STANDBY	Standby mode
3'b010	MODE_IDLE	Idle mode
3'b011	MODE_SLEEP	Sleep mode
3'b100	MODE_HIBERNATE	Hibernate mode
3'b110	MODE_HIBTIMERS	Hibernate+timewheels

1.3.67   PM_USB_CR0

USB Power Mode Control Register 0

Reset: Reset Signals Listed Below

Register : Address

PM_USB_CR0: 0x40004394

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:1	R/W:0
HW Access	NA					R	R	R
Retention	NA					NONRET	RET	RET
Name	RSVD					fsusbio_pd_pullup_n	fsusbio_pd_n	fsusbio_ref_en

This register controls settings for USB low power mode.

Bits	Name	Description
2	fsusbio_pd_pullup_n	USB IO pad pullup enable. When set, the USBIO pad pullups can be used. When clear, the pullups are forced off. The pullups cannot be enabled until the appropriate supply is available. For example, if the USB regulator is configured, it must be stable before enabling the pullup or it may result in output glitches. The general guideline is to wait at least 2us after setting fsusbio_pd_n=1 before setting this field. This requirement is in addition to the reference settling time (if applicable).
1	fsusbio_pd_n	USB IO pad enable. When set, the USBIO pads can be used. When clear, the USBIO pads latch their previous settings and powerdown. This field must be high to use the pads for USB or GPIO modes. If USB is unavailable (wounded) the pads will ignore this setting and will remain disabled.
0	fsusbio_ref_en	USB IO pad receiver and regulator reference enable. The reference is required when using the USBIO pins for USB signaling. It is used by the differential receiver and USB regulator. The reference is NOT required when using the USBIO pins for GPIO signaling. Before enabling USB signaling in {USB_CR0}, enable this bit and allow the reference to settle. Settling time is max(1us after enabling, 40us after power restored). Power loss occurs during reset or when entering a deep low power mode (idle, sleep, or hibernate). Power is considered restored when reset deasserts or when the core supply reaches the PRES threshold after a wakeup. This field is retained so that if the core supply is kept up (eg. idle or sleep), the delay can be measured from the wakeup event.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	fsusbio_ref_en, fsusbio_pd_n
Domain reset for non-retention flops [reset_all_nonretention]	fsusbio_pd_pullup_n

1.3.68   PM_WAKEUP_CFG0

Power Mode Wakeup Mask Configuration Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_WAKEUP_CFG0: 0x40004398

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	mask_sleep	mask_clkpm	mask_boost	mask_cpu	mask_i2c	mask_picu	mask_tc	mask_int

This register masks the power mode wakeup sources.

Bits	Name	Description
7	mask_sleep	When set, the PM CTW and PM 1PPS (RTC) can return the chip to active mode.
6	mask_clkpm	When set, the PM FTW, LVI or HVI can return the chip to active mode.
5	mask_boost	When set, boost undervoltage can return the chip to active mode.
4	mask_cpu	When set, a CPU bus transaction can return the chip to active mode.
3	mask_i2c	When set, I2C can return the chip to active mode.
2	mask_picu	When set, the PICU can return the chip to active mode.
1	mask_tc	When set, the Test Controller can return the chip to active mode.
0	mask_int	When set, on-chip interrupts can return the chip to active mode.

1.3.69   PM_WAKEUP_CFG1

Power Mode Wakeup Mask Configuration Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_WAKEUP_CFG1: 0x40004399

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	mask_cmp7	mask_cmp6	mask_cmp5	mask_cmp4	mask_cmp3	mask_cmp2	mask_cmp1	mask_cmp0

This register masks the power mode wakeup sources.

Bits	Name	Description
7	mask_cmp7	Reserved for comparator 7
6	mask_cmp6	Reserved for comparator 6
5	mask_cmp5	Reserved for comparator 5
4	mask_cmp4	Reserved for comparator 4
3	mask_cmp3	When set, comparator 3 can return the chip to active mode.
2	mask_cmp2	When set, comparator 2 can return the chip to active mode.
1	mask_cmp1	When set, comparator 1 can return the chip to active mode.
0	mask_cmp0	When set, comparator 0 can return the chip to active mode.

1.3.70   PM_WAKEUP_CFG2

Power Mode Wakeup Mask Configuration Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_WAKEUP_CFG2: 0x4000439A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:1
HW Access	NA							R
Retention	NA							RET
Name	RSVD							mask_lcd

This register masks the power mode wakeup sources.

Bits	Name	Description
0	mask_lcd	When set, LCD can return the chip to active mode.

1.3.71   PM_ACT_CFG0

Active Power Mode Configuration Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG0: 0x400043A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:1	R/W:0	NA:000		
HW Access	R	R	R	R	R	NA		
Retention	RET	RET	RET	RET	RET	NA		
Name	en_delay	en_udbarray	en_imo36m	en_imo	en_clk_spc	RSVD		

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7	en_delay	Global enable for clkdist delay line. For Aclk's to be running this bit must be set, When this bit is LOW Aclk's can't toggle.
6	en_udbarray	Global enable for UDB array.
5	en_imo36m	Enable IMO SPC clock source. This also internally enables the IMO, since it is required for the 36MHz IMO to function.
4	en_imo	Enable IMO clock source. Any wakeup event will set this bit.
3	en_clk_spc	Enable clk_spc. This also internally enables the 36MHz IMO (similar to en_imo36m), since this is required for the SPC to function.

1.3.72   PM_ACT_CFG1

Active Power Mode Configuration Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG1: 0x400043A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_clk_a			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_clk_a[3:0]	Enable clk_a[3:0]

1.3.73   PM_ACT_CFG2

Active Power Mode Configuration Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG2: 0x400043A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	en_clk_d							

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7:0	en_clk_d[7:0]	Enable clk_d[7:0]

1.3.74   PM_ACT_CFG3

Active Power Mode Configuration Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG3: 0x400043A3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_timer			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_timer[3:0]	Enable timer/counters.

1.3.75 PM_ACT_CFG4

Active Power Mode Configuration Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG4: 0x400043A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_opamp			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_opamp[3:0]	Enable analog linear output buffer.

1.3.76   PM_ACT_CFG5

Active Power Mode Configuration Register 5

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG5: 0x400043A5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	en_emif	RSVD	en_lcd	RSVD	en_i2c	RSVD	en_fsusb

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
6	en_emif	Enable EMIF
4	en_lcd	Enable LCD.
2	en_i2c	Enable I2C block(s). Populated subsystems are counted from the LSB.
0	en_fsusb	Enable FS-USB.

1.3.77   PM_ACT_CFG6

Active Power Mode Configuration Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG6: 0x400043A6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dfb	RSVD			en_can

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dfb	Enable DFB(s). Populated subsystems are counted from the LSB.
0	en_can	Enable CAN block(s). Populated subsystems are counted from the LSB.

1.3.78   PM_ACT_CFG7

Active Power Mode Configuration Register 7

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG7: 0x400043A7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_cmp			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_cmp[3:0]	Enable comparator(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to comparator 0.

1.3.79   PM_ACT_CFG8

Active Power Mode Configuration Register 8

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG8: 0x400043A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_dac			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_dac[3:0]	Enable DAC block(s). Populated subsystems are counted from the LSB.

1.3.80 PM_ACT_CFG9

Active Power Mode Configuration Register 9

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG9: 0x400043A9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_swcap			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_swcap[3:0]	Enable switchcap block(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to switchcap block 0.

1.3.81   PM_ACT_CFG10

Active Power Mode Configuration Register 10

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG10: 0x400043AA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dsm_channel	RSVD			en_dec

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dsm_channel	Enable delta-sigma modulator ADC channel. Note: set the appropriate enables in the analog interface prior to setting this global enable for the channel.
0	en_dec	Enable decimator(s). Populated subsystems are counted from the LSB.

1.3.82 PM_ACT_CFG11

Active Power Mode Configuration Register 11

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG11: 0x400043AB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:00		R/W:00	
HW Access	NA		R	R	NA		R	
Retention	NA		RET	RET	NA		RET	
Name	RSVD		en_refbufr	en_refbufl	RSVD		en_sar	

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
5	en_refbufr	Enable RIGHT analog reference buffer (refbufr)
4	en_refbufl	Enable LEFT analog reference buffer (refbufl)
1:0	en_sar[1:0]	Enable SAR(s). Populated subsystems are counted from the LSB.

1.3.83   PM_ACT_CFG12

Active Power Mode Configuration Register 12

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG12: 0x400043AC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:1111			
HW Access	NA			R	R			
Retention	NA			RET	RET			
Name	RSVD			en_ee	en_fm			

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_ee	Enable EEPROM. Re-enabling an EEPROM macro takes 5us. During this time, the EE will not acknowledge a PHUB request.
3:0	en_fm[3:0]	Enable flash. Active flash macros consume current, but re-enabling a disabled flash macro takes 5us. If the CPU attempts to fetch out of the macro during that time, it will be stalled. This bit allows the flash to be enabled even if the CPU is disabled, which allows a quicker return to code execution. To avoid a deadlock where the CPU attempts to fetch out of a disabled macro, the flash macro will ignore this bit if the CPU is enabled in user mode. During test mode, the flash CAN be turned off independently from the CPU.

1.3.84   PM_ACT_CFG13

Active Power Mode Configuration Register 13

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_ACT_CFG13: 0x400043AD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1	R/W:1	R/W:1	R/W:1
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				en_ports	en_picu	en_sysmem	en_anaif

This register enables subsystems during the active power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3	en_ports	Enable ports. This must be enabled to read/write registers in the port logic.
2	en_picu	Enable PICU. This must be enabled to read/write registers in the PICU. Configured wakeups will continue to function if the PICU is disabled, but the interface must be enabled to clear the interrupt condition.
1	en_sysmem	Enable SYSMEM. This must be enabled to read/write the SYSMEM.
0	en_anaif	Enable analog interface. This must be enabled to read/write registers in the analog interface.

1.3.85   PM_STBY_CFG0

Standby Power Mode Configuration Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG0: 0x400043B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:1	R/W:0	NA:000		
HW Access	R	R	R	R	R	NA		
Retention	RET	RET	RET	RET	RET	NA		
Name	en_delay	en_udbarray	en_imo36m	en_imo	en_clk_spc	RSVD		

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7	en_delay	Global enable for clkdist delay line. For Aclk's to be running this bit must be set, When this bit is LOW Aclk's can't toggle.
6	en_udbarray	Global enable for UDB array.
5	en_imo36m	Enable IMO SPC clock source. This also internally enables the IMO, since it is required for the 36MHz IMO to function.
4	en_imo	Enable IMO clock source. Any wakeup event will set this bit.
3	en_clk_spc	Enable clk_spc. This also internally enables the 36MHz IMO (similar to en_imo36m), since this is required for the SPC to function.

1.3.86   PM_STBY_CFG1

Standby Power Mode Configuration Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG1: 0x400043B1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_clk_a			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_clk_a[3:0]	Enable clk_a[3:0]

1.3.87   PM_STBY_CFG2

Standby Power Mode Configuration Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG2: 0x400043B2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	en_clk_d							

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
7:0	en_clk_d[7:0]	Enable clk_d[7:0]

1.3.88   PM_STBY_CFG3

Standby Power Mode Configuration Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG3: 0x400043B3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_timer			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_timer[3:0]	Enable timer/counters.

1.3.89　PM_STBY_CFG4

Standby Power Mode Configuration Register 4

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG4: 0x400043B4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_opamp			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_opamp[3:0]	Enable analog linear output buffer.

1.3.90   PM_STBY_CFG5

Standby Power Mode Configuration Register 5

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG5: 0x400043B5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	en_emif	RSVD	en_lcd	RSVD	en_i2c	RSVD	en_fsusb

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
6	en_emif	Enable EMIF
4	en_lcd	Enable LCD.
2	en_i2c	Enable I2C block(s). Populated subsystems are counted from the LSB.
0	en_fsusb	Enable FS-USB.

1.3.91   PM_STBY_CFG6

Standby Power Mode Configuration Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG6: 0x400043B6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset		NA:000		R/W:0		NA:000		R/W:0
HW Access		NA		R		NA		R
Retention		NA		RET		NA		RET
Name		RSVD		en_dfb		RSVD		en_can

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dfb	Enable DFB(s). Populated subsystems are counted from the LSB.
0	en_can	Enable CAN block(s). Populated subsystems are counted from the LSB.

1.3.92   PM_STBY_CFG7

Standby Power Mode Configuration Register 7

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG7: 0x400043B7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_cmp			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_cmp[3:0]	Enable comparator(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to comparator 0.

1.3.93   PM_STBY_CFG8

Standby Power Mode Configuration Register 8

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG8: 0x400043B8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_dac			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_dac[3:0]	Enable DAC block(s). Populated subsystems are counted from the LSB.

1.3.94   PM_STBY_CFG9

Standby Power Mode Configuration Register 9

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG9: 0x400043B9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				en_swcap			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3:0	en_swcap[3:0]	Enable switchcap block(s). Populated subsystems are counted from the LSB, for example bit 0 corresponds to switchcap block 0.

1.3.95   PM_STBY_CFG10

Standby Power Mode Configuration Register 10

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG10: 0x400043BA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	NA:000			R/W:0
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			en_dsm_ch annel	RSVD			en_dec

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_dsm_channel	Enable delta-sigma modulator ADC channel. Note: set the appropriate enables in the analog interface prior to setting this global enable for the channel.
0	en_dec	Enable decimator(s). Populated subsystems are counted from the LSB.

1.3.96   PM_STBY_CFG11

Standby Power Mode Configuration Register 11

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG11: 0x400043BB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:00		R/W:00	
HW Access	NA		R	R	NA		R	
Retention	NA		RET	RET	NA		RET	
Name	RSVD		en_refbufr	en_refbufl	RSVD		en_sar	

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
5	en_refbufr	Enable RIGHT analog reference buffer (refbufr)
4	en_refbufl	Enable LEFT analog reference buffer (refbufl)
1:0	en_sar[1:0]	Enable SAR(s). Populated subsystems are counted from the LSB.

1.3.97   PM_STBY_CFG12

Standby Power Mode Configuration Register 12

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG12: 0x400043BC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0000			
HW Access	NA			R	R			
Retention	NA			RET	RET			
Name	RSVD			en_ee	en_fm			

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
4	en_ee	Enable EEPROM. Re-enabling an EEPROM macro takes 5us. During this time, the EE will not acknowledge a PHUB request.
3:0	en_fm[3:0]	Enable flash. Active flash macros consume current, but re-enabling a disabled flash macro takes 5us. If the CPU attempts to fetch out of the macro during that time, it will be stalled. This bit allows the flash to be enabled even if the CPU is disabled, which allows a quicker return to code execution. To avoid a deadlock where the CPU attempts to fetch out of a disabled macro, the flash macro will ignore this bit if the CPU is enabled in user mode. During test mode, the flash CAN be turned off independently from the CPU.

1.3.98   PM_STBY_CFG13

Standby Power Mode Configuration Register 13

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_STBY_CFG13: 0x400043BD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:1	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				en_ports	en_picu	en_sysmem	en_anaif

This register enables subsystems during the standby power mode. Attempts to enable unavailable subsystems are ignored.

Bits	Name	Description
3	en_ports	Enable ports. This must be enabled to read/write registers in the port logic.
2	en_picu	Enable PICU. This must be enabled to read/write registers in the PICU. Configured wakeups will continue to function if the PICU is disabled, but the interface must be enabled to clear the interrupt condition.
1	en_sysmem	Enable SYSMEM. This must be enabled to read/write the SYSMEM.
0	en_anaif	Enable analog interface. This must be enabled to read/write registers in the analog interface.

1.3.99   PM_AVAIL_CR0

Power Mode Available Subsystem Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR0: 0x400043C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1111			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				avail_fm			

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
3:0	avail_fm[3:0]	Each set bit requests a flash macro be available. Reactivation is delayed. Macro 0 can only be disabled during test_mode.

1.3.100   PM_AVAIL_CR1

Power Mode Available Subsystem Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR1: 0x400043C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1111			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				avail_sysmem			

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
3:0	avail_sysmem[3:0]	Each set bit requests a sysmem macro be available. Reactivation is delayed. Populated subsystems are counted from the LSB.

1.3.101 PM_AVAIL_CR2

Power Mode Available Subsystem Control Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR2: 0x400043C2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:000			R/W:1
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			avail_udb	RSVD			avail_ee

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_udb	Each set bit requests a UDB bank be available. Reactivation is delayed. If user needs UDB never clear this bit. If user clears this bit, then user has to reconfigure the UDB.
0	avail_ee	Each set bit requests a EEPROM macro be available. Reactivation is delayed.

1.3.102   PM_AVAIL_CR3

Power Mode Available Subsystem Control Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR3: 0x400043C3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:000			R/W:1
HW Access	NA			R	NA			R
Retention	NA			RET	NA			RET
Name	RSVD			avail_sysmemtrace	RSVD			avail_dfb

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_sysemtrace	Each set bit requests a trace memory be available. Reactivation is delayed.
0	avail_dfb	Each set bit requests a DFB be available. Reactivation is delayed.

1.3.103   PM_AVAIL_CR4

Power Mode Available Subsystem Control Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR4: 0x400043C4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:0	R/W:1	NA:0	R/W:1
HW Access	NA			R	NA	R	NA	R
Retention	NA			RET	NA	RET	NA	RET
Name	RSVD			avail_i2c	RSVD	avail_main	RSVD	avail_spc

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_i2c	When set, requests I2C be available. Reactivation is delayed.
2	avail_main	When set, requests main domain be available (default and necessary for most functionality). The main domain can only be disabled in test mode. There is no isolation in the UDB, DSM or the pumps, so also set avail_udb, avail_dsm_channel and avail_anapump low to avoid static current. Reactivation is delayed.
0	avail_spc	When set, requests SPC be available. Reactivation is delayed.

1.3.104 PM_AVAIL_CR5

Power Mode Available Subsystem Control Register 5

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR5: 0x400043C5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:1
HW Access	NA							R
Retention	NA							RET
Name	RSVD							avail_dsm_ channel

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
0	avail_dsm_channel	Each set bit requests a delsig channel be available. Reactivation is immediate.

1.3.105 PM_AVAIL_CR6

Power Mode Available Subsystem Control Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_CR6: 0x400043C6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:1	NA:00		R/W:1	R/W:1
HW Access	NA			R	NA		R	R
Retention	NA			RET	NA		RET	RET
Name	RSVD			avail_anami sc2	RSVD		avail_anapu mp	avail_anami sc

This register allows subsystems to be flagged as available or unavailable. Flagging a subsystem unavailable can result in lower power consumption during returns from sleep and hibernate. Some subsystems can only be flagged unavailable during test mode.

Bits	Name	Description
4	avail_anamisc2	When set, requests miscellaneous analog (group 2) be available. This register is a placeholder and presently has no fanout. Reactivation is immediate.
1	avail_anapump	When set, requests analog pump be available. Reactivation is immediate.
0	avail_anamisc	When set, requests miscellaneous analog be available. Reactivation is immediate.

1.3.106   PM_AVAIL_SR0

Power Mode Available Subsystem Status Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR0: 0x400043D0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:1111			
HW Access	NA				W			
Retention	NA				RET			
Name	RSVD				avail_fm			

This register indicates whether a subsystem is available or not.

Bits	Name	Description
3:0	avail_fm[3:0]	Each set bit indicates an available flash macro.

1.3.107   PM_AVAIL_SR1

Power Mode Available Subsystem Status Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR1: 0x400043D1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:1111			
HW Access	NA				W			
Retention	NA				RET			
Name	RSVD				avail_sysmem			

This register indicates whether a subsystem is available or not.

Bits	Name	Description
3:0	avail_sysmem[3:0]	Each set bit requests a sysmem macro be available. Reactivation is delayed. Populated subsystems are counted from the LSB.

1.3.108   PM_AVAIL_SR2

Power Mode Available Subsystem Status Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR2: 0x400043D2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset		NA:000		R:1		NA:000		R:1
HW Access		NA		W		NA		W
Retention		NA		RET		NA		RET
Name		RSVD		avail_udb		RSVD		avail_ee

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_udb	Each set bit indicates an available UDB bank.
0	avail_ee	Each set bit indicates an available EEPROM macro.

1.3.109   PM_AVAIL_SR3

Power Mode Available Subsystem Status Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR3: 0x400043D3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:1	NA:000			R:1
HW Access	NA			W	NA			W
Retention	NA			RET	NA			RET
Name	RSVD			avail_sysme mtrace	RSVD			avail_dfb

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_sysmemtrace	Each set bit indicates an available trace memory.
0	avail_dfb	Each set bit indicates an available DFB.

1.3.110   PM_AVAIL_SR4

Power Mode Available Subsystem Status Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR4: 0x400043D4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset		NA:000		R:1	NA:0	R:1	NA:0	R:1
HW Access		NA		W	NA	W	NA	W
Retention		NA		RET	NA	RET	NA	RET
Name		RSVD		avail_i2c	RSVD	avail_main	RSVD	avail_spc

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_i2c	When set, I2C is available.
2	avail_main	When set, main domain is available.
0	avail_spc	When set, SPC is available.

1.3.111 PM_AVAIL_SR5

Power Mode Available Subsystem Status Register 5

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR5: 0x400043D5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:1
HW Access	NA							W
Retention	NA							RET
Name	RSVD							avail_dsm_channel

This register indicates whether a subsystem is available or not.

Bits	Name	Description
0	avail_dsm_channel	Each set bit indicates an available delsig channel.

1.3.112   PM_AVAIL_SR6

Power Mode Available Subsystem Status Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PM_AVAIL_SR6: 0x400043D6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:1	NA:00		R:1	R:1
HW Access	NA			W	NA		W	W
Retention	NA			RET	NA		RET	RET
Name	RSVD			avail_anamisc2	RSVD		avail_anapump	avail_anamisc

This register indicates whether a subsystem is available or not.

Bits	Name	Description
4	avail_anamisc2	When set, miscellaneous analog (group 2) is available.
1	avail_anapump	When set, analog pump is available.
0	avail_anamisc	When set, miscellaneous analog is available.

1.3.113 PICU[0..15]_INTTYPE[0..7]

Port Interrupt Control Type Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						INTTYPE	

This register configures the type of interrupt for a pin. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
1:0	INTTYPE[1:0]	This field configures the type of interrupt type enabled. See Table 1-73.

Table 1-73. Bit field encoding: INTTYPE_ENUM

Value	Name	Description
2'b00	DISABLE	Disable Interrupts for pin.
2'b01	RISING_EDGE	Enable Rising Edge Interrupts for pin.
2'b10	FALLING_EDGE	Enable Falling Edge Interrupts for pin.
2'b11	CHANGE_MODE	Enable Both Edge Interrupts for pin.

1.3.114   PICU[0..15]_INTSTAT

Port Interrupt Control Status Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

PICU0_INTSTAT: 0x40004580   PICU1_INTSTAT: 0x40004581

PICU2_INTSTAT: 0x40004582   PICU3_INTSTAT: 0x40004583

PICU4_INTSTAT: 0x40004584   PICU5_INTSTAT: 0x40004585

PICU6_INTSTAT: 0x40004586   PICU12_INTSTAT: 0x4000458C

PICU15_INTSTAT: 0x4000458F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	RC:0	RC:0	RC:0	RC:0	RC:0	RC:0	RC:0	RC:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	STAT7	STAT6	STAT5	STAT4	STAT3	STAT2	STAT1	STAT0

This register provides information on the recently posted interrupts.

Bits	Name	Description
7	Interrupt Status {STAT7}	Pin 7 Interrupt Status See Table 1-74.
6	Interrupt Status {STAT6}	Pin 6 Interrupt Status See Table 1-74.
5	Interrupt Status {STAT5}	Pin 5 Interrupt Status See Table 1-74.
4	Interrupt Status {STAT4}	Pin 4 Interrupt Status See Table 1-74.
3	Interrupt Status {STAT3}	Pin 3 Interrupt Status See Table 1-74.
2	Interrupt Status {STAT2}	Pin 2 Interrupt Status See Table 1-74.
1	Interrupt Status {STAT1}	Pin 1 Interrupt Status See Table 1-74.
0	Interrupt Status {STAT0}	Pin 0 Interrupt Status See Table 1-74.

Table 1-74. Bit field encoding: INTSTAT_ENUM

Value	Name	Description
1'b1	INT_PENDING	Indicates an interrupt is pending.
1'b0	NO_INT	Indicates no interrupt is pending.

1.3.115   PICU[0..14]_SNAP

Port Interrupt Control Snap Shot Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

PICU0_SNAP: 0x40004590   PICU1_SNAP: 0x40004591

PICU2_SNAP: 0x40004592   PICU3_SNAP: 0x40004593

PICU4_SNAP: 0x40004594   PICU5_SNAP: 0x40004595

PICU6_SNAP: 0x40004596   PICU12_SNAP: 0x4000459C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	SNAPSHOT							

This register provides information on the state of input pins at recent read to Status register. An exception is this register will not be updated when status register is read with DISABLE_COR or CORD bit in MLOGIC.DEBUG register set

Bits	Name	Description
7:0	SNAPSHOT[7:0]	Contains input pin values at recent read to status register

1.3.116 PICU_15_SNAP_15

Port Interrupt Control Snap Shot Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

PICU_15_SNAP_15: 0x4000459F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:11000000							
HW Access	R/W							
Retention	RET							
Name	SNAPSHOT							

This register provides information on the state of input pins at recent read to Status register. An exception is this register will not be updated when status register is read with DISABLE_COR or CORD bit in MLOGIC.DEBUG register set

Bits	Name	Description
7:0	SNAPSHOT[7:0]	Contains input pin values at recent read to status register

1.3.117   PICU[0..15]_DISABLE_COR

Disable Status Register Clear on Read Feature

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

PICU0_DISABLE_COR: 0x400045A0

PICU1_DISABLE_COR: 0x400045A1

PICU2_DISABLE_COR: 0x400045A2

PICU3_DISABLE_COR: 0x400045A3

PICU4_DISABLE_COR: 0x400045A4

PICU5_DISABLE_COR: 0x400045A5

PICU6_DISABLE_COR: 0x400045A6

PICU12_DISABLE_COR: 0x400045AC

PICU15_DISABLE_COR: 0x400045AF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							DISABLE_COR

This register is provided to disable the clear on read feature of Status Register. Either this register bit or CORD bit in MLOGIC.DEBUG register can disable the clear on read feature of status register. The interrupt will be cleared when both DISABLE_COR is 1'b0, CORD bit in MLOGIC.DEBUG register is 1'b0 and there is a status register read. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
0	DISABLE_COR	1'b0: Status Register is Clear On Read. 1'b1: Disable the Clear on Read feature of Status Register.

1.3.118   DAC[0..3]_TR

DAC Block Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_TR: 0x40004608   DAC1_TR: 0x40004609

DAC2_TR: 0x4000460A   DAC3_TR: 0x4000460B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	tr							

Bits	Name	Description
7:0	tr[7:0]	8 Calibration bits

1.3.119   NPUMP_DSM_TR0

Delta Sigma Modulator (DSM) Negative Pump Trim Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NPUMP_DSM_TR0: 0x40004610

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						npump_dsm_trim	

Bits	Name	Description
1:0	npump_dsm_trim[1:0]	Delta Sigma Modulator (DSM) Negative Pump Trim

1.3.120　NPUMP_SC_TR0

Switched Cap Negative Pump Trim Register 0

Reset:　　　　System reset for retention flops [reset_all_retention]

Register : Address

NPUMP_SC_TR0: 0x40004611

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						npump_sc_trim	

Bits	Name	Description
1:0	npump_sc_trim[1:0]	Switched Cap Negative Pump Trim

1.3.121 NPUMP_OPAMP_TR0

Analog Linear Output Buffer (OPAMP) Negative Pump Trim Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NPUMP_OPAMP_TR0: 0x40004612

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						npump_opamp_trim	

Bits	Name	Description
1:0	npump_opamp_trim[1:0]	Analog Linear Output Buffer (OPAMP) Negative Pump Trim

1.3.122 OPAMP[0..3]_TR0

Analog Output Buffer Trim Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

OPAMP0_TR0: 0x40004620   OPAMP1_TR0: 0x40004622

OPAMP2_TR0: 0x40004624   OPAMP3_TR0: 0x40004626

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R				
Retention	NA			RET				
Name	RSVD			offset_trim				

Bits	Name	Description
4:0	offset_trim[4:0]	Offset Trim: 420uV typical step size; +/- 6.8mV offset trimmable range

1.3.123   OPAMP[0..3]_TR1

Analog Output Buffer Trim Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

OPAMP0_TR1: 0x40004621   OPAMP1_TR1: 0x40004623

OPAMP2_TR1: 0x40004625   OPAMP3_TR1: 0x40004627

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved for OPAMP expansion

1.3.124   CMP[0..3]_TR0

Comparator Trim Register for PMOS Load

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_TR0: 0x40004630   CMP1_TR0: 0x40004632

CMP2_TR0: 0x40004634   CMP3_TR0: 0x40004636

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0000			
HW Access	NA			R	R			
Retention	NA			RET	RET			
Name	RSVD			trim_pmos_sel	trim_pmos_mag			

Bits	Name	Description
4	trim_pmos_sel	Selects the side of the pmos load to which the trim magnitude is applied
		See Table 1-76.
3:0	trim_pmos_mag[3:0]	Sets the trim magnitude of the pmos load for offset calibration
		See Table 1-75.

Table 1-75. Bit field encoding: TRIM_PMAG_ENUM

Value	Name	Description
4'h0	TRIM_PMAG_0	Does not add any offset.
4'h1	TRIM_PMAG_1	Adds offset of ~1mV to side selected by trim_pmos_sel bit
4'h2	TRIM_PMAG_2	Adds offset of ~2mV to side selected by trim_pmos_sel bit
4'h3	TRIM_PMAG_3	Adds offset of ~3mV to side selected by trim_pmos_sel bit
4'h4	TRIM_PMAG_4	Adds offset of ~4mV to side selected by trim_pmos_sel bit
4'h5	TRIM_PMAG_5	Adds offset of ~5mV to side selected by trim_pmos_sel bit
4'h6	TRIM_PMAG_6	Adds offset of ~6mV to side selected by trim_pmos_sel bit
4'h7	TRIM_PMAG_7	Adds offset of ~7mV to side selected by trim_pmos_sel bit
4'h8	TRIM_PMAG_8	Adds offset of ~8mV to side selected by trim_pmos_sel bit
4'h9	TRIM_PMAG_9	Adds offset of ~9mV to side selected by trim_pmos_sel bit
4'ha	TRIM_PMAG_A	Adds offset of ~10mV to side selected by trim_pmos_sel bit
4'hb	TRIM_PMAG_B	Adds offset of ~11mV to side selected by trim_pmos_sel bit
4'hc	TRIM_PMAG_C	Adds offset of ~12mV to side selected by trim_pmos_sel bit
4'hd	TRIM_PMAG_D	Adds offset of ~13mV to side selected by trim_pmos_sel bit
4'he	TRIM_PMAG_E	Adds offset of ~14mV to side selected by trim_pmos_sel bit
4'hf	TRIM_PMAG_F	Adds offset of ~15mV to side selected by trim_pmos_sel bit

Table 1-76. Bit field encoding: TRIM_PSEL_ENUM

Value	Name	Description
1'b0	TRIM_PSEL_0	Trim the positive side of the pmos load
1'b1	TRIM_PSEL_1	Trim the negative side of the pmos load

1.3.125 CMP[0..3]_TR1

Comparator Trim Register for NMOS Load

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_TR1: 0x40004631   CMP1_TR1: 0x40004633

CMP2_TR1: 0x40004635   CMP3_TR1: 0x40004637

Table 1-78. Bit field encoding: TRIM_NSEL_ENUM

Value	Name	Description
1'b0	TRIM_NSEL_0	Trim the negative side of the nmos load
1'b1	TRIM_NSEL_1	Trim the positive side of the nmos load

1.3.126   PWRSYS_HIB_TR0

Hibernate Trim Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_HIB_TR0: 0x40004680

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1111				R/W:0000			
HW Access	R				R			
Retention	RET				RET			
Name	trim				biasg			

This register trims the hibernate regulator, which generates the vpwrka supply.

Bits	Name	Description
7:4	trim[3:0]	Hibernate regulator trim.
3:0	biasg[3:0]	Hibernate regulator biasg tweak trim. During powerup hib/slp holdoff specified in PWRSYS_SLP_TR, this trim is internally forced to 4'b0001 until the hib/slp powerup holdoff is finished. This register can be written and will readback normally during the force condition (ie the force condition will not be seen during readback). After the force condition ends, the contents of this register will be applied to the hib/slp regulator.

1.3.127   PWRSYS_HIB_TR1

Hibernate Trim Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_HIB_TR1: 0x40004681

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:1011			
HW Access	R	R			R			
Retention	RET	RET			RET			
Name	dis_hibernate	rbb_trim			enleg			

This register trims the hibernate regulator and reverse body bias generator.

Bits	Name	Description
7	dis_hibernate	Setting this bit will disable hibernate mode.
6:4	rbb_trim[2:0]	Reverse body bias generator trim.
3:0	enleg[3:0]	Each set bit enables a current leg of the hibernate regulator for the keepalive supply.

1.3.128 PWRSYS_I2C_TR

I2C Regulator Trim Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_I2C_TR: 0x40004682

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			NA:00		R/W:11	
HW Access	NA	R			NA		R	
Retention	NA	RET			NA		RET	
Name	RSVD	restrim			RSVD		trim	

This register trims the I2C regulator.

Bits	Name	Description
6:4	restrim[2:0]	I2C regulator series resistor trim.
1:0	trim[1:0]	I2C regulator trim.

1.3.129 PWRSYS_SLP_TR

Sleep Regulator Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_SLP_TR: 0x40004683

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:111			R/W:0	R/W:0011			
HW Access	R			R	R			
Retention	RET			RET	RET			
Name	hibslp_holdoff			bypass	trim			

This register trims the sleep regulator.

Bits	Name	Description
7:5	hibslp_holdoff[2:0]	Number of 1kHz ILO clocks before the hibernate/sleep regulator is ready after a chip reset. Before it is ready, the system will ignore power mode requests except active and standby. It also overrides trim settings for the hibernate/sleep regulator. See Table 1-79.
4	bypass	When set, disables the sleep regulator and shorts vccd to vpwrsleep. The bypass is internally shorted until hibslp_holdoff expires.
3:0	trim[3:0]	Sleep regulator trim.

Table 1-79. Bit field encoding: holdoff_enum

Value	Name	Description
3'b000	HOLDOFF0	0 clocks => disables holdoff
3'b001	HOLDOFF1	1 clocks => 0-1ms
3'b010	HOLDOFF2	2 clocks => 1-2ms
3'b011	HOLDOFF3	3 clocks => 2-3ms
3'b100	HOLDOFF4	4 clocks => 3-4ms
3'b101	HOLDOFF5	5 clocks => 4-5ms
3'b110	HOLDOFF6	6 clocks => 5-6ms
3'b111	HOLDOFF7	7 clocks => 6-7ms

1.3.130   PWRSYS_BUZZ_TR

Power Mode Buzz Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_BUZZ_TR: 0x40004684

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0011				R/W:0011			
HW Access	R				R			
Retention	NA				RET			
Name	RSVD				slp_buzz			

This register trims the settings for system sampling (buzzing).

Bits	Name	Description
7:4	RSVD[3:0]	Reserved
3:0	slp_buzz[3:0]	Sets the buzz rate for digital and analog LDOs during sleep mode See Table 1-80.

Table 1-80. Bit field encoding: psoc3pwrmgr_pwrsys_trim_buzz_enum

Value	Name	Description
4'b0000	BUZZ_2_TICKS	2 CTW ticks ==> 2ms
4'b0001	BUZZ_4_TICKS	4 CTW ticks ==> 4ms
4'b0010	BUZZ_8_TICKS	8 CTW ticks ==> 8ms
4'b0011	BUZZ_16_TICKS	16 CTW ticks ==> 16ms
4'b0100	BUZZ_32_TICKS	32 CTW ticks ==> 32ms
4'b0101	BUZZ_64_TICKS	64 CTW ticks ==> 64ms
4'b0110	BUZZ_128_TICKS	128 CTW ticks ==> 128ms
4'b0111	BUZZ_256_TICKS	256 CTW ticks ==> 256ms
4'b1000	BUZZ_512_TICKS	512 CTW ticks ==> 512ms

1.3.131 PWRSYS_WAKE_TR0

Power Mode Wakeup Trim Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_WAKE_TR0: 0x40004685

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01111111							
HW Access	R							
Retention	RET							
Name	wake_to_interval							

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
7:0	wake_to_interval[7:0]	Sets the timeout time to wait until allowing a reset from the PRES-A or PRES-D propagates to the hard reset logic. Prior to this timeout, the power manager prevents PRES output signals from resetting the device. After this timeout, a reset indication from either PRES circuit will cause a system hard reset. The timeout time is (wake_precnt+1)*wake_to_interval IMO cycles running at wake_imofreq. To avoid reset on wake from hibernate, this register must be changed to 0xFF prior to hibernate entry. The register may be restored to 0x7F upon wake from hibernate to return to the wakeup default for subsequent sleep wakeups. It is safe to leave the register at 0xFF for all wakeups, but it must be written to 0xFF prior to the first hibernate entry.

1.3.132   PWRSYS_WAKE_TR1

Power Mode Wakeup Trim Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_WAKE_TR1: 0x40004686

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:1	NA:0	R/W:000			R/W:000		
HW Access	NA	NA	R			R		
Retention	NA	NA	RET			RET		
Name	RSVD	RSVD	wake_precnt			wake_imofreq		

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
5:3	wake_precnt[2:0]	Sets the wakeup precount value for the timeout counter {PWRSYS.WAKE_TR0} and holdoff counter {PWRSYS.WAKE_TR3}. Thus precount value also scales the timing of the wakeup sequencer that enables internal power domains. Wakeup timing is specified at 12MHz. If a different wake_imofreq is used, wake_precnt is used to adjust the wakeup timing back to 12MHz. A larger precount value may also be used to allow for longer PRES timeout intervals (controlled by wake_ho_interval as well). Note that the actual precount value is wake_precnt + 1. To avoid reset on wake from hibernate, wake_precnt must be written to 6 (divide by 7) prior to hibernate entry. To preserve datasheet wakeup time from sleep, wake_precnt must be restored to the default value of 0 (divide by 1) upon wakeup from hibernate. See Table 1-82.
2:0	wake_imofreq[2:0]	Sets the IMO frequency used during chip wakeup from a low power mode. See Table 1-81.

Table 1-81. Bit field encoding: fimo_freq_enum

Value	Name	Description
3'b000	FIMO_12MHZ	12 MHz
3'b001	FIMO_RSVD001	RESERVED
3'b010	FIMO_24MHZ	UNSUPPORTED
3'b011	FIMO_RSVD011	RESERVED
3'b100	FIMO_48MHZ	UNSUPPORTED
3'b101	FIMO_RSVD101	RESERVED
3'b110	FIMO_RSVD110	RESERVED
3'b111	FIMO_RSVD111	RESERVED

Table 1-82. Bit field encoding: wake_precnt_enum

Value	Name	Description
3'b000	WPC1	Wakeup sequencer and counters run at FIMO frequency divided by 1 (sleep wakeup)
3'b001	WPC2	Wakeup sequencer and counters run at FIMO frequency divided by 2
3'b010	WPC3	Wakeup sequencer and counters run at FIMO frequency divided by 3
3'b011	WPC4	Wakeup sequencer and counters run at FIMO frequency divided by 4
3'b100	WPC5	Wakeup sequencer and counters run at FIMO frequency divided by 5
3'b101	WPC6	Wakeup sequencer and counters run at FIMO frequency divided by 6
3'b110	WPC7	Wakeup sequencer and counters run at FIMO frequency divided by 7 (hibernate wake-up)
3'b111	WPC8	Wakeup sequencer and counters run at FIMO frequency divided by 8

1.3.133   PWRSYS_BREF_TR

Boot Reference Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_BREF_TR: 0x40004687

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	NA:00		R/W:1	R/W:0	R/W:1	R/W:1	R/W:0
HW Access	R	NA		R	R	R	R	R
Retention	RET	NA		RET	RET	RET	RET	RET
Name	bref_manual	RSVD		bref_force_turbo	bref_testmode_reg	bref_en_reg	bref_outen_reg	bref_refsw_reg

This registers configures the power system boot reference..

Bits	Name	Description
7	bref_manual	This bit must be written low in the manufacturing trim portion of the test program. When set the other fields in this register allow manual bootref control, which is for RMP and char purposes only. When clear, the power manager will automatically switch the bootref output between the bootref voltage itself and the LVBG after resets and wakeups. When clear, at power up and wakeup, the power manager forces the LDO and LPCOMP references to be the boot reference till device wakes-up (meaning untill CPU starts running on wakeup). bootref is disabled while device wakeup when this bit is set AND device is in externally regulated VCCA and VCCD mode AND PWRSYS_WAKE_TR2[2] is set At the above configuration regular LPCOMPs are used to detect power good during Hibernate and Hibernate timers mode. Since reference is disabled, device can't wakeup from hibernate and hibernate timer modes. Make sure PWRSYS_WAKE_TR2[2] is cleared during Hibertnate, Hibernate Timers mode
4	bref_force_turbo	reserved
3	bref_testmode_reg	When bref_manual is set, this puts the bootref in testmode.
2	bref_en_reg	When bref_manual is set, this fields enables the internal boot reference. This field must be set whenever either LDO is on.
1	bref_outen_reg	When bref_manual is set, this fields enables the output stage of the LDO reference selector. This field must be set prior to selecting the BREF source using bref_refsw_reg.
0	bref_refsw_reg	When bref_manual is set, this fields controls the power system reference source. Using the LVBG reference improves PSRR. See Table 1-83.

Table 1-83. Bit field encoding: bref_refsw_enum

Value	Name	Description
1'b0	BREF	BREF (boot reference)
1'b1	LVBG	LVBG (low voltage band gap)

1.3.134   PWRSYS_BG_TR

Bandgap Trim

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_BG_TR: 0x40004688

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:00000				
HW Access	NA	R	NA	R				
Retention	NA	RET	NA	RET				
Name	RSVD	trimbuf_fine	RSVD	inl_ctl				

Bandgap Trim

Bits	Name	Description
6	trimbuf_fine	Current Bandgap - nonlinear current control (fine tuning)
4:0	inl_ctl[4:0]	Current Bandgap - nonlinear current control

1.3.135   PWRSYS_WAKE_TR2

Power Mode Wakeup Trim Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_WAKE_TR2: 0x40004689

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	NA		R	R	R	R	R	R
Retention	NA		RET	RET	RET	RET	RET	RET
Name	RSVD		use_early_short	use_vccd_backup	use_vcca_backup	use_vccdclk_det	use_bgwkup_fast	en_buzz

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
5	use_early_short	Enable early shorting between vccd/vnwell/vpwrao/vpwrka. When set, the shorts will be applied at the wakeup event for sleep and idle modes. If clear or a wakeup from hibernate mode, shorts will be applied at the powergood event. Note that if early shorting is used, it is critical that vccd be at a valid voltage (>1.2V) for proper logic retention. If it is not, then state loss can occur including WDT failure. If using internal regulation, it is recommended to set use_vccd_backup and use_vcca_backup to ensure that the supply is valid. This bit is in a protected register segment to avoid accidental corruption. This bit must be set to achieve the wake time specs when using internal regulation for vccd.
4	use_vccd_backup	Enable replica regulated vccd supply. When using internal regulation for vccd, this bit enables a backup regulator that keeps vccd during sleep and idle modes. When clear, buzzing should be enabled to ensure that vccd remains high enough to meet the wake time requirement. If the buzzing approach is used, it is highly recommended to use the LPCOMP powergood detection scheme (use_vccdclk_det=0), since it is robust if vccd droops. This bit must be set to achieve the wake time specs when using the internal regulation for vccd. If the chip is configured for external vccd supply using {PWRSYS_CR0}.ext_vccd, then this bit is ignored.
3	use_vcca_backup	Enable replica regulated vcca supply. When using internal regulation for vcca, this bit enables a backup regulator that keeps vcca during sleep and idle modes. When clear, buzzing should be enabled to ensure that vcca remains high enough to meet the wake time requirement. If the buzzing approach is used, it is highly recommended to use the LPCOMP powergood detection scheme (use_vccdclk_det=0), since it is robust if vcca droops. This bit must be set to achieve the wake time specs when using the internal regulation for vcca. If the chip is configured for external vcca supply using {PWRSYS_CR0}.ext_vcca, then this bit is ignored.
2	use_vccdclk_det	Enable alternate powergood detector. When set, a faster powergood detector is used during wakeup from sleep only, during other times LPCOMPs are used. When clear, the LPCOMPs are used. Make sure this bit is never set during externally regulated device low power modes Hibernate and Hibernate timers, because bootref is disabled during wakeup. The alternate powergood detector is faster, but it relies on valid vccd and vcca supplies. It is recommended to use it with the replica regulators (use_vccd_backup and use_vcca_backup) or external supplies. The LPCOMP detector is slower but is robust to droops on vcca and vccd. This bit must be set to achieve the wake time specs.
1	use_bgwkup_fast	Enable fast BG wakeup. This bit must be set to achieve the wake time specs.
0	en_buzz	Enable buzz wakeups. Buzzing wakes the regulators (if configured) and performs periodic voltage supervision.

1.3.136 PWRSYS_WAKE_TR3

Power Mode Wakeup Trim Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PWRSYS_WAKE_TR3: 0x4000468A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:01011111							
HW Access	R							
Retention	RET							
Name	wake_ho_interval							

This register configures the settings for waking up the chip from low power modes.

Bits	Name	Description
7:0	wake_ho_interval[7:0]	Sets the holdoff time to wait until sampling PRES-A/D. The holdoff time is (wake_precnt+1)*wake_ho_interval IMO cycles running at wake_imofreq.

1.3.137   ILO_TR0

Internal Low-speed Oscillator Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ILO_TR0: 0x40004690

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1000				R/W:1000			
HW Access	R				R			
Retention	RET				RET			
Name	tr_100k				tr_1k			

This register is used to trim the frequency of the ILO output clocks.

Bits	Name	Description
7:4	tr_100k[3:0]	Trim setting for 100 kHz output
		See Table 1-84.
3:0	tr_1k[3:0]	Trim setting for 1 kHz output
		See Table 1-85.

Table 1-84. Bit field encoding: TR_100K_ENUM

Value	Name	Description
4'b0000	TR_100K_MIN	Minimum Frequency
4'b1111	TR_100K_MAX	Maximum Frequency

Table 1-85. Bit field encoding: TR_1K_ENUM

Value	Name	Description
4'b0000	TR_1K_MIN	Minimum Frequency
4'b1111	TR_1K_MAX	Maximum Frequency

1.3.138   ILO_TR1

Internal Low-speed Oscillator Coarse Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ILO_TR1: 0x40004691

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:10	
HW Access	NA					R	R	
Retention	NA					RET	RET	
Name	RSVD					ct_range	ctrim	

This register is used to trim the frequency of the ILO output clocks.

Bits	Name	Description
2	ct_range	Coarse Trim Range select for ILO
		See Table 1-87.
1:0	ctrim[1:0]	Coarse Trim Setting for ILO
		See Table 1-86.

Table 1-86. Bit field encoding: CTRIM_ENUM

Value	Name	Description
2'h0	CTRIM_0	Full Resistor (lowest current, lowest frequency)
2'h1	CTRIM_1	3/4 * R
2'h2	CTRIM_2	1/2 * R
2'h3	CTRIM_3	1/4 * R (highest current, highest frequency)

Table 1-87. Bit field encoding: CT_RANGE_ENUM

Value	Name	Description
1'b0	CT_RANGE_0	Normal range
1'b1	CT_RANGE_1	Lower current range

1.3.139   X32_TR

32 kHz Watch Crystal Oscillator Trim Register

Reset: System reset for always on flops [reset_all_alwayson]

Register : Address

X32_TR: 0x40004698

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:101		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					xgm		

Bits	Name	Description
2:0	xgm[2:0]	Amplifier GM setting, applies to both High and Low power modes
		See Table 1-88.

Table 1-88. Bit field encoding: XGM_ENUM

Value	Name	Description
3'b000	XGM_MAX	Highest current setting
3'b101	XGM_DEFAULT	Default setting
3'b111	XGM_MIN	Lowest current setting

1.3.140   IMO_TR0

Internal Main Oscillator Trim Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

IMO_TR0: 0x400046A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:111			NA:00000				
HW Access	R/W			NA				
Retention	RET			NA				
Name	imo_lsb			RSVD				

This register contains the frequency trim for the IMO. For each frequency range, a separate factory trim should be loaded into this register. It is recommended that the user not change the value of this register. When changing frequency ranges, the new trim value should be applied at the lowest freqency range. For example, when switching to a high range, first apply the trim value of the higher range, then switch the IMO to that range. If switching to a lower range, change the range first and then apply the new trim value.

Bits	Name	Description
7:5	imo_lsb[2:0]	These are the 3 LSB of the IMO frequency trim. Normally these are not changed by the user, and are only modified by the hardware during USB clock-locking. These bits are locked from user write when USB Oscillator locking is enabled.
		See Table 1-89.

Table 1-89. Bit field encoding: IMO_LSB_ENUM

Value	Name	Description
3'b000	IMO_LSB_MIN	minimum value
3'b111	IMO_LSB_MAX	maximum value

1.3.141 IMO_TR1

Internal Main Oscillator Trim Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

IMO_TR1: 0x400046A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:10011101							
HW Access	R/W							
Retention	RET							
Name	imo_trim							

IMO Trim for 48 MHz frequency setting

Bits	Name	Description
7:0	imo_trim[7:0]	Frequency trim (8 MSbits) for the IMO. 8 MSbits of the trim. The factory trim only uses these 8 bits; the 3 LSbits (IMO_LSB[2:0]) are normally only used during USB operation. These bits are locked from user write when USB Oscillator locking is enabled. See Table 1-90.

Table 1-90. Bit field encoding: IMO_TRIM_ENUM

Value	Name	Description
8'h00	IMO_TRIM_MIN	Minimum frequency
8'hff	IMO_TRIM_MAX	Maximum frequency

1.3.142   IMO_GAIN

Internal Main Oscillator Gain Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

IMO_GAIN: 0x400046A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:001111					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		gain					

This register contains the gain trim for the IMO. This is normally set with a factory trim and not modified by the user.

Bits	Name	Description
5:0	gain[5:0]	Gain trim for the IMO. This controls the kHz/step of the trim setting in the IMO_TR register.
		See Table 1-91.

Table 1-91. Bit field encoding: GAIN_ENUM

Value	Name	Description
6'h00	GAIN_MAX	Maximum Gain
6'h3F	GAIN_MIN	Minimum Gain

1.3.143   IMO_C36M

Internal Main Oscillator 36 MHz clock control register {INTERNAL}

Reset: System reset for retention flops [reset_all_retention]

Register : Address

IMO_C36M: 0x400046A3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				tr36			

This register controls operation of the 36 Mhz output of the IMO.

Bits	Name	Description
3:0	tr36[3:0]	Frequency trim for the 36 MHz SPC clock. This value should not be changed by the user.
		See Table 1-92.

Table 1-92. Bit field encoding: TR36_ENUM

Value	Name	Description
4'h0	TR36_MIN	Minimum frequency
4'hf	TR36_MAX	Maximum frequency

1.3.144   IMO_TR2

Internal Main Oscillator Trim Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

IMO_TR2: 0x400046A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:000110					
HW Access	R	NA	R					
Retention	RET	NA	RET					
Name	pll_trim	RSVD	fimo_trim					

This register contains the frequency trim for the IMO during fastwake mode.

Bits	Name	Description
7	pll_trim	PLL trim for VCO duty cycle. Must be set to 1'b0 in production test and firmware.
5:0	fimo_trim[5:0]	Frequency trim for the IMO in fastwake mode (FIMO). This value should not be changed by the user. Reset default value for bits 5:4 will be overwritten by NVLatch bits during boot

See Table 1-93.

Table 1-93. Bit field encoding: FIMO_TRIM_ENUM

Value	Name	Description
6'h00	FIMO_TRIM_MIN	Minimum frequency
6'h3f	FIMO_TRIM_MAX	Maximum frequency

1.3.145 XMHZ_TR

External 4-25 MHz Crystal Oscillator Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

XMHZ_TR: 0x400046A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				iref			

Bits	Name	Description
3:0	iref[3:0]	This bit adjusts the output current of the oscillator circuit. The value is selected to match the output external crystal characteristics. See Table 1-94.

Table 1-94. Bit field encoding: IREF_ENUM

Value	Name	Description
4'h0	IREF_0	13 unit resistors
4'h1	IREF_1	14 unit resistors
4'h2	IREF_2	15 unit resistors
4'h3	IREF_3	16 unit resistors
4'h4	IREF_4	17 unit resistors
4'h5	IREF_5	18 unit resistors
4'h6	IREF_6	19 unit resistors
4'h7	IREF_7	20 unit resistors
4'h8	IREF_8	21 unit resistors
4'h9	IREF_9	22 unit resistors
4'ha	IREF_A	23 unit resistors
4'hb	IREF_B	24 unit resistors
4'hc	IREF_C	25 unit resistors
4'hd	IREF_D	26 unit resistors
4'he	IREF_E	27 unit resistors
4'hf	IREF_F	28 unit resistors

1.3.146   DLY

Delay block Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DLY: 0x400046C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:00		R/W:00000				
HW Access	NA	R		R				
Retention	NA	RET		RET				
Name	RSVD	CTRIM		FTRIM				

This register is used to trim the delay cell tap duration. This register should only be used when the delay cell is in trim mode (see CLKDIST_DLY1 MODE bit). This register can also be accessed via it's alias, the CLKDIST_DLY0 register **User Defined Properties:** unique_name_space=1

Bits	Name	Description
6:5	CTRIM[1:0]	Course trim bits for delay block
		See Table 1-95.
4:0	FTRIM[4:0]	Fine trim bits for delay block 5'b00000 Lowest bias ... ... 5'bfffff Highest bias

Table 1-95. Bit field encoding: CTRIM_ENUM

Value	Name	Description
2'b00	ZERO	Highest bias setting
2'b10	TWO	Second highest bias setting
2'b01	ONE	Third highest bias setting
2'b11	THREE	Fourth highest bias setting

1.3.147   MLOGIC_DMPSTR

Dumpster Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

MLOGIC_DMPSTR: 0x400046E2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	RET							
Name	dumpster							

Bits	Name	Description
7:0	dumpster[7:0]	Dummy register used to pad the manufacturing configuration table. If the MFGCFG table has less than 63 data/address pairs, the remaining pairs write to this register to ensure nothing configured incorrectly

1.3.148 MLOGIC_SEG_CR

Segment Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

MLOGIC_SEG_CR: 0x400046E4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:10110100							
HW Access	R							
Retention	RET							
Name	segment_control							

Bits	Name	Description
7:0	segment_control[7:0]	Segment Control, controls write access to the segment register. When 0xB5 is written the lock on the Segment Configuration is removed. When 0xB4 is written, the Segment Configuration bits are locked and may only be read. Writing any other value triggers a reset.

1.3.149 MLOGIC_SEG_CFG0

Segment Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

MLOGIC_SEG_CFG0: 0x400046E5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOSET:0	R/W:0	R/WOSET:0	R/W:0	R/WOSET:0	R/W:0	R/WOSET:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	lock_protect_3	lock_3	lock_protect_2	lock_2	lock_protect_1	lock_1	lock_protect_0	lock_0

Bits	Name	Description
7	lock_protect_3	Segment Lock Protect
6	lock_3	Segment Lock
5	lock_protect_2	Segment Lock Protect
4	lock_2	Segment Lock
3	lock_protect_1	Segment Lock Protect
2	lock_1	Segment Lock
1	lock_protect_0	Segment Lock Protect
0	lock_0	Segment Lock

1.3.150   MLOGIC_DEBUG

MLOGIC Debug Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

MLOGIC_DEBUG: 0x400046E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:0
HW Access	NA	R	R	R	R	R	R	NA
Retention	NA	RET	RET	RET	RET	RET	RET	NA
Name	RSVD	allow_rst_hrd	dis_dbg_prt	CORD	swv_clk_sel	swv_clk_en	dis_swd_list	RSVD

Bits	Name	Description
6	allow_rst_hrd	Allows XRES to generate a hard reset during JTAG and SWD mode. This bit should not be set at the same time as dis_dbg_prt. Both bits set together will not allow the debug port to be re-claimed without a port acquire
5	dis_dbg_prt	Disable Debug Port, removes port overrides of debug port so that the JTAG/SWD pins can be used as GPIOs. This bit should not be set at the same time as allow_rst_hrd. Both bits set to-gether will not allow the debug port to be reclaimed without a port acquire
4	CORD	0x0: Reading RC registers clears the values in them. 0x1: Clear on Read Disabled. Values in RC registers are not cleared when read.
3	swv_clk_sel	Serial Wire Viewer (SWV) trace clock select. When set to '0' SWD clock is used for trace clock. When set to '1' clk_cpu/2 is used for trace clock
2	swv_clk_en	Serial Wire View (SWV) clock enable. When set to '1' the clocks for SWV are enabled. This bit must be set to '1' to use SWV
1	dis_swd_list	Disable SWD Listening of the Test Controller, forces the SWDO from the CM3's DAP to always be the output in SWD mode.

1.3.151   MLOGIC_CPU_SCR_CPU_SCR

System Status and Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

MLOGIC_CPU_SCR_CPU_SCR: 0x400046EA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:0	R:1	R:0	R:0
HW Access	NA				R/W	R/W	R/W	R
Retention	NA				RET	RET	RET	NA
Name	RSVD				wol	boot	tmode	RESERVED

Bits	Name	Description
3	wol	Write Once Latch Status
2	boot	Boot. Cleared by the Checksum block upon completion of the boot process.
1	tmode	Test Mode Status
0	RESERVED	Reserved

1.3.152   RESET_IPOR_CR0

Imprecise Power On Reset Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_IPOR_CR0: 0x400046F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0xD4 to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

1.3.153   RESET_IPOR_CR1

Imprecise Power On Reset Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_IPOR_CR1: 0x400046F1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0xAA to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

1.3.154   RESET_IPOR_CR2

Imprecise Power On Reset Control Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_IPOR_CR2: 0x400046F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0x56 to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

1.3.155   RESET_IPOR_CR3

Imprecise Power On Reset Control Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_IPOR_CR3: 0x400046F3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	code							

The IPOR has a 32-bit internal register that disables the IPOR circuits when a certain code is written. This register is split into four 8-bit sections. None of these bits are set on power-up (they are allowed to power-up in a random state). Once the IPOR is disabled in all four registers, any invalid key write to any of the registers causes a hardware reset.

Bits	Name	Description
7:0	code[7:0]	Write 0xC9 to disable this portion of the code. Once the entire code is disabled, any invalid key write will cause a hardware reset.

1.3.156   RESET_CR0

LVI Set Point Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_CR0: 0x400046F4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0000				R/W:0000			
HW Access	R				R			
Retention	RET				RET			
Name	lvia				lvid			

Bits	Name	Description
7:4	lvia[3:0]	When LVI-A is enabled, these 4 bits select the trip point of the detector. See Table 1-96.
3:0	lvid[3:0]	When LVI-D is enabled, these 4 bits select the trip point of the detector. See Table 1-97.

Table 1-96. Bit field encoding: lvia_sel

Value	Name	Description
4'b0000	LVIA_0	1.73V
4'b0001	LVIA_1	1.95v
4'b0010	LVIA_2	2.20V
4'b0011	LVIA_3	2.45V
4'b0100	LVIA_4	2.71V
4'b0101	LVIA_5	2.95V
4'b0110	LVIA_6	3.21V
4'b0111	LVIA_7	3.46V
4'b1000	LVIA_8	3.70V
4'b1001	LVIA_9	3.95V
4'b1010	LVIA_A	4.20V

4'b1110	LVID_E	5.21V
4'b1111	LVID_F	5.47V

1.3.157 RESET_CR1

Reset System Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_CR1: 0x400046F5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				vmon_hvi_sel	en_hvia	en_lvia	en_lvid

This register enables circuits in the reset subsystem.

Bits	Name	Description
3	vmon_hvi_sel	When set to 1, this bit enables the vmon to look at the VDDD. When this bit is cleared to 0, the vmon looks at the VDDA.
2	en_hvia	When set to 1, enables the high-voltage-interrupt feature on the external analog supply. When this bit is set, there is a possible glitch on the output. To account for this glitch the user must mask the interrupt prior to setting this bit, then clear the status register immediately after this bit is set. Only then this circuit is ready for use.
1	en_lvia	Enables the low-voltage-interrupt or reset feature on the external analog supply. When this bit is set to 1 along with the en_presa bit (RESET_CR3 bit 7) set to 1, the lvia becomes an additional reset source through the presa reset path. When this bit is set to 1 along with the en_presa bit (RESET_CR3 bit 7) cleared to 0, the lvia becomes an interrupt source. When this bit is cleared to 0, the bit state (either a zero or a one) of the en_presa bit (RESET_CR3 bit 7) has no impact on the reset or interrupt functionality. When this bit is set, there is a possible glitch on the output. To account for this glitch the user must mask the interrupt prior to setting this bit, then clear the status register immediately after this bit is set. Only then this circuit is ready for use.
0	en_lvid	Enables the low-voltage-interrupt or reset feature on the external digital supply. When this bit is set to 1 along with the en_presd bit (RESET_CR3 bit 6) set to 1, the lvid becomes an additional reset source through the presd reset path. When this bit is set to 1 along with the en_presd bit (RESET_CR3 bit 6) cleared to 0, the lvid becomes an interrupt source. When this bit is cleared to 0, the bit state (either a zero or a one) of the en_presd bit (RESET_CR3 bit 6) has no impact on the reset or interrupt functionality. When this bit is set, there is a possible glitch on the output. To account for this glitch the user must mask the interrupt prior to setting this bit, then clear the status register immediately after this bit is set. Only then this circuit is ready for use.

1.3.158   RESET_CR2

Software Reset Control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

RESET_CR2: 0x400046F6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							swr

This register control the software reset (SWR).

Bits	Name	Description
0	swr	Setting this bit will cause a system reset.

1.3.159   RESET_CR3

LVI Mode Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_CR3: 0x400046F7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	NA:000			NA:000		
HW Access	R	R	NA			NA		
Retention	RET	RET	NA			NA		
Name	en_presa	en_presd	RSVD			RSVD		

This register controls mode settings for the LVI detector.

Bits	Name	Description
7	en_presa	When this bit is set to 1 along with the en_lvia bit (RESET_CR1 bit 1) set to 1 , the lvia becomes an additional reset source through the presa reset path. When this bit is cleared to 0 along with the en_lvia bit (RESET_CR1 bit 1) set to 1, the lvia is only used as an interrupt source. If the en_lvia bit (RESET_CR1 bit 1) is cleared to 0, the bit state (either a zero or a one) has no impact on the reset or interrupt functionality. This bit is in segment 0.
6	en_presd	When this bit is set to 1 along with the en_lvid bit (RESET_CR1 bit 0) set to 1 , the lvid becomes an additional reset source through the presd reset path. When this bit is cleared to 0 along with the en_lvid bit (RESET_CR1 bit 0) set to 1, the lvid is only used as an interrupt source. If the en_lvid bit (RESET_CR1 bit 0) is cleared to 0, the bit state (either a zero or a one) has no impact on the reset or interrupt functionality. This bit is in segment 0.

Table 1-98. Bit field encoding: tmux_sel

Value	Name	Description
3'b000	TMODE_000	Normal mode (output driven to vgnd)
3'b001	TMODE_001	PRES-D
3'b010	TMODE_010	PRES-A
3'b011	TMODE_011	LVI-D
3'b100	TMODE_100	LVI-A
3'b101	TMODE_101	HVI-A
3'b110	TMODE_110	LPCOMP-D (set => powergood)
3'b111	TMODE_111	LPCOMP-A (set => powergood)

1.3.160   RESET_CR4

Reset Ignore Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_CR4: 0x400046F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:1	R/W:1	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			ignore_hbr1	ignore_lpcompa1	ignore_lpcompd1	ignore_presa1	ignore_presd1

This register configures the system to ignore certain reset sources.

Bits	Name	Description
4	ignore_hbr1	When both this bit and ignore_hbr2 are set to 1, the HBR circuit is disabled.
3	ignore_lpcompa1	When both this bit and ignore_lpcompa2 are set to 1, the LPCOMP-A circuits is disabled. Before entering Low Power Modes (LPM), this bit must be high.
2	ignore_lpcompd1	When both this bit and ignore_lpcompd2 are set to 1, the LPCOMP-D circuit is disabled. Before entering Low Power Modes (LPM), this bit must be high.
1	ignore_presa1	When both this bit and ignore_presa2 are set to 1, the PRES-A circuits is disabled.
0	ignore_presd1	When both this bit and ignore_presd2 are set to 1, the PRES-D circuit is disabled.

1.3.161   RESET_CR5

Reset Ignore Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_CR5: 0x400046F9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:1	R/W:1	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			ignore_hbr2	ignore_lpcompa2	ignore_lpcompd2	ignore_presa2	ignore_presd2

This register configures the system to ignore certain reset sources.

Bits	Name	Description
4	ignore_hbr2	When both this bit and ignore_hbr1 are set to 1, the HBR circuit is disabled.
3	ignore_lpcompa2	When both this bit and ignore_lpcompa1 are set to 1, the LPCOMP-A circuits is disabled. Before entering Low Power Modes (LPM), this bit must be high.
2	ignore_lpcompd2	When both this bit and ignore_lpcompd1 are set to 1, the LPCOMP-D circuit is disabled. Before entering Low Power Modes (LPM), this bit must be high.
1	ignore_presa2	When both this bit and ignore_presa1 are set to 1, the PRES-A circuits is disabled.
0	ignore_presd2	When both this bit and ignore_presd1 are set to 1, the PRES-D circuit is disabled.

1.3.162   RESET_SR0

Reset and Voltage Detection Status Register 0

Reset: Reset Signals Listed Below

Register : Address

RESET_SR0: 0x400046FA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		RC:0	NA:0	RC:0	RC:0	RC:0	RC:0
HW Access	NA		R/W	NA	R/W	R/W	R/W	R/W
Retention	RET		RET	NA	RET	NONRET	NONRET	NONRET
Name	gpsw_s		swr_s	RSVD	wdr_s	hvia_s	lvia_s	lvid_s

This register gives persistent status for the reset and voltage detection systems.

Bits	Name	Description
7:6	gpsw_s[1:0]	General purpose status for user software. These bits can be set to 1 or cleared to 0 by software and only reset by hard reset sources. They can be used to hold user defined status that persists through many resets.
5	swr_s	Persistent status of the software reset. This bit will be set to 1 when a software reset occurs and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
3	wdr_s	Persistent status of the watchdog reset. This bit will be set to 1 when a watchdog reset occurs and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
2	hvia_s	Persistent status of analog HVI. This bit will be set to 1 when the analog supply goes below the trip point for the HVI detector and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
1	lvia_s	Persistent status of analog LVI. This bit will be set to 1 when the analog supply goes below the trip point for the LVI detector and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)
0	lvid_s	Persistent status of digital LVI. This bit will be set to 1 when the digital supply goes below the trip point for the LVI detector and will stay set to 1 until cleared to 0 by the user or reset. Sticky (whole field)

Reset Table

Reset Signal	Applicable Register Bit(s)
IPOR/PRES/HBR for retention flops [reset_hard_retention]	wdr_s, swr_s, gpsw_s[1:0]
IPOR/PRES/HBR for non-retention flops [reset_hard_nonretention]	lvid_s, lvia_s, hvia_s

1.3.163   RESET_SR1

Reset and Voltage Detection Status Register 1

Reset: IPOR/PRES/HBR for non-retention flops [reset_hard_nonretention]

Register : Address

RESET_SR1: 0x400046FB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	RC:0	RC:0	RC:0	RC:0	NA:00		RC:0
HW Access	NA	R/W	R/W	R/W	R/W	NA		R/W
Retention	NA	NONRET	NONRET	NONRET	NONRET	NA		NONRET
Name	RSVD	lpcompa_s	lpcompd_s	presa_s	presd_s	RSVD		segr_s

This register gives persistent status for the reset and voltage detection systems.

Bits	Name	Description
6	lpcompa_s	Persistent status of analog LPCOMP. This bit will be set to 1 when the analog supply goes below the trip point for the LPCOMP circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the LPCOMP-A circuit does not cause a system reset. Sticky (whole field)
5	lpcompd_s	Persistent status of digital LPCOMP. This bit will be set to 1 when the digital supply goes below the trip point for the LPCOMP circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the LPCOMP-D circuit does not cause a system reset. Sticky (whole field)
4	presa_s	Persistent status of analog PRES. This bit will be set to 1 when the analog supply goes below the trip point for the PRES circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the PRES-A circuit does not cause a system reset. Sticky (whole field)
3	presd_s	Persistent status of digital PRES. This bit will be set to 1 when the digital supply goes below the trip point for the PRES circuit and will stay set to 1 until cleared to 0 by the user or reset. Note that this field is only useful during test mode when the PRES-D circuit does not cause a system reset. Sticky (whole field)
0	segr_s	Persistent status of the segment reset. This bit will be set to 1 when the segment reset occurs circuit and will stay set to 1 until cleared to 0 by the user or reset. Note a segment reset occurs when a value other than 0xB4 or 0xB5 is written to the Segment Control Register. Sticky (whole field)

1.3.164   RESET_SR2

Reset and Voltage Detection Status Register 2

Reset: IPOR/PRES/HBR for non-retention flops [reset_hard_nonretention]

Register : Address

RESET_SR2: 0x400046FC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:0	R:0	R:0	R:0	R:0	R:0	R:0
HW Access	W	W	W	W	W	W	W	W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	hbrs_r	lpcompa_r	lpcompd_r	presa_r	presd_r	hvia_r	lvia_r	lvid_r

This register gives real-time status for the reset and voltage detection systems.

Bits	Name	Description
7	hbrs_r	Real-time status of HBR. This is only useful when the HBR does not cause a system level reset.
6	lpcompa_r	Real-time status of analog LPCOMP. This is only useful when the LPCOMP-A output is ignored.
5	lpcompd_r	Real-time status of digital LPCOMP. This is only useful when the LPCOMP-D output is ignored.
4	presa_r	Real-time status of analog PRES. This is only useful when the PRES-A output is ignored.
3	presd_r	Real-time status of digital PRES. This is only useful when the PRES-D output is ignored.
2	hvia_r	Real-time status of analog HVI.
1	lvia_r	Real-time status of analog LVI.
0	lvid_r	Real-time status of digital LVI.

1.3.165   RESET_SR3

Reset and Voltage Detection Status Register 3

Reset: IPOR/PRES/HBR for retention flops [reset_hard_retention]

Register : Address

RESET_SR3: 0x400046FD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0000				R:1	NA:000		
HW Access	R/W				W	NA		
Retention	RET				RET	NA		
Name	cksm_fail_cnts				ipor_key_n	RSVD		

This register gives persistent status for the reset and voltage detection systems.

Bits	Name	Description
7:4	cksm_fail_cnts[3:0]	Count of the number of times the Checksum process has failed, causing a reset. These 4 bits will hold the count value and it will stay until cleared to 0 by a reset.
3	ipor_key_n	IPOR key status. When low, the IPOR key has been properly written using the IPOR_CR registers.

1.3.166 RESET_TR

PRES Trim Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

RESET_TR: 0x400046FE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0111				R/W:0111			
HW Access	R				R			
Retention	RET				RET			
Name	presa				presd			

This register sets the trim for the precision voltage detectors (PRES).

Bits	Name	Description
7:4	presa[3:0]	Trim for PRES-A. Default value sets the trip to 1.6V
3:0	presd[3:0]	Trim for PRES-D. Default value sets the trip to 1.6V

1.3.167   SPC_FM_EE_CR

FM_EE_CR

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SPC_FM_EE_CR: 0x40004700

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:0	NA:000			R/W:0	R/W:0
HW Access	NA		R/W	NA			R	R
Retention	NA		RET	NA			RET	RET
Name	RSVD		EE_AWAKE	RSVD			EE_Priority	FM_Priority

This register contains control bits for the flash and eeprom arrays

Bits	Name	Description
5	EE_AWAKE	Status signal to denote that the EEPROM array is awake & powered, when set equal to 1. On reset, this value is 0. When the EEPROM is enabled, after the 5 us startup time has elapsed, the bit will be set to a 1.
1	EE_Priority	Sets priority between the PHUB and the SPC for who gets control of the EEPROM array upon simultaneous access requests. 1-> SPC has priority. 0-> PHUB has priority.
0	FM_Priority	Sets priority between the cache controller and the SPC for who gets control of the flash array upon simultaneous access requests. 1-> SPC has priority. 0-> Cache controller has priority.

1.3.168   SPC_FM_EE_WAKE_CNT

FM_EE_WAKE_CNT

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SPC_FM_EE_WAKE_CNT: 0x40004701

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00011110						
HW Access	R						
Retention	RET						
Name	Wake_Count						

Flash/EEPROM Wake Count Register

Bits	Name	Description
7:0	Wake_Count[7:0]	The wake count defines the number of Bus Clock cycles it takes for the flash or eeprom to wake up from being in a put into a low power mode independent of the chip power mode (while the rest of the chip remained in active or standby). Wake up time for these blocks is 5 us. The granularity of this register is 2 Bus Clock cycles, so a value of 0x1E (30d) defines the wake up time as 60 cycles of the Bus Clock. This register needs to be written with a value dependent on the Bus Clock frequency so that the duration of the cycles is equal to or greater than the 5 us delay required. The reset value of this register (0x1E) is for a Bus Clock frequency of 12 MHz.

1.3.169 SPC_EE_SCR

EEPROM Status & Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SPC_EE_SCR: 0x40004702

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R:0	R/W:0
HW Access	NA						R/W	R
Retention	NA						RET	RET
Name	RSVD						EE_AHB_ACK	AHB_EE_REQ

This register contains status and control bits for the EEPROM array.

Bits	Name	Description
1	EE_AHB_ACK	Once the AHB_EE_REQ bit is set, this bit is set high once the EEPROM is available to be read across the PHUB interface.
0	AHB_EE_REQ	This bit is set high when a read access of the EEPROM, through the PHUB interface, is desired. This is a request bit and is part of a two bit interface with the EE_AHB_ACK bit.

1.3.170   SPC_EE_ERR

EEPROM Error Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SPC_EE_ERR: 0x40004703

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							EEPROM_error

This register has an error bit for the EEPROM array on the chip. The error bit indicates whether or not the array has had a collision error where two masters (the SPC and the PHUB interface) attempted to access the array simultaneously. The bits are cleared upon a read of this register.

Bits	Name	Description
0	EEPROM_error	Error bit for EEPROM array 0

1.3.171 SPC_CPU_DATA

SPC CPU Data Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

SPC_CPU_DATA: 0x40004720

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	CPU_Data							

This register is the command interface to the SPC that allows SPC instructions to be executed by the host CPU writing a sequential series of parameters to this location. This register is meant only for the CPU and not the DMA controller to prevent collisions between the CPU and the DMAC when both attempt to call a function in the SPC

Bits	Name	Description
7:0	CPU_Data[7:0]	CPU Data.

1.3.172   SPC_DMA_DATA

SPC DMA Data Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

SPC_DMA_DATA: 0x40004721

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	DMA_Data							

This register is the command interface to the SPC that allows SPC instructions to be executed by the DMA controller writing a sequential series of parameters to this location. This register is meant only for the DMA Controller and not the CPU to prevent collisions between the CPU and the DMAC when both attempt to call a function in the SPC

Bits	Name	Description
7:0	DMA_Data[7:0]	DMA Data.

1.3.173   SPC_SR

SPC Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SPC_SR: 0x40004722

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:000000						R:1	R:0
HW Access	R/W						R/W	R/W
Retention	RET						RET	RET
Name	Status_Code						SPC_Idle	Data_Ready

This register returns the current status of the SPC and the exit status of the last complete SPC instruction.

Bits	Name	Description
7:2	Status_Code[5:0]	The Status Code represents the exit status of the last executed SPC instruction.
		See Table 1-101.
1	SPC_Idle	This bit indicates whether or not the SPC is currently executing an instruction. The bit transitions low as soon as the 1st byte of the 2-byte command key (0xB6) is written into the SPC CPU or DMA Data Register. The bit transitions high as soon as an instruction completes or if the 2nd byte of the command key is invalid.
		See Table 1-100.
0	Data_Ready	This bit indicates whether or not the SPC has data that is ready to be read from the SPC CPU or DMA Data Register.
		See Table 1-99.

Table 1-99. Bit field encoding: DATA_RDY_ENUM

Value	Name	Description
1'h0	DATA_IS_NOT_RDY	The SPC isn't ready for the next byte to be written
1'h1	DATA_IS_RDY	The SPC is read for the next byte to be written

Table 1-100. Bit field encoding: INSTR_IDLE_ENUM

Value	Name	Description
1'h0	INSTR_IS_NOT_IDLE	SPC is currently executing an SPC instruction.
1'h1	INSTR_IS_IDLE	SPC is idle and not busy executing an instruction.

Table 1-101. Bit field encoding: SPC_SR_STATUS_CODE_ENUM

Value	Name	Description
6'h0	SPC_SR_OPERATION_ SUCCESS	Operation Successful
6'h1	SPC_SR_INVALID_ARR AY_ID	Invalid Array ID for given command
6'h2	SPC_SR_INVALID_2_B YTE_KEY	Invalid 2-byte key
6'h3	SPC_SR_ADDR_ARRY _IS_ASLEEP	Addressed Array is Asleep
6'h4	SPC_SR_EXTERNAL_A CCESS_FAILURE	External Access Failure (SPC is not in external access mode)

1.3.173   SPC_SR (continued)

Table 1-101. Bit field encoding: SPC_SR_STATUS_CODE_ENUM

6'h5	SPC_SR_INVALID_N_VALUE	Invalid N Value for given command
6'h6	SPC_SR_TEST_MODE_FAILURE	Test Mode Failure (SPC is not in test mode)
6'h7	SPC_SR_SMART_WRITE_ALGO_CHKSUM	Smart Write Algorithm Checksum Failure
6'h8	SPC_SR_SMART_WRITE_PARAM_CHKSUM	Smart Write Parameter Checksum Failure
6'h9	SPC_SR_PROTECTION_CHK_FAILURE	Protection Check Failure: protection settings are in a state which prevents the given command from executing
6'hA	SPC_SR_INVALID_ADDR_PARAM	Invalid Address parameter for the given command
6'hB	SPC_SR_INVALID_CMD_CODE	Invalid Command Code
6'hC	SPC_SR_INVALID_ROW_ID	Invalid Row ID parameter for given command
6'hD	SPC_SR_INVALID_INPUT_GET_TEMP_ADC	Invalid input value for Get Temp & Get ADC commands
6'hE	SPC_SR_TMP_SENSOR_VBR_DRIVEN_EXT_DEV	Tempsensor Vbe is currently driven to an external device
6'hF	SPC_SR_INVALID_SPC_STATE	Invalid SPC state (M8G's PC value out of range. Manual SPC Reset required)
6'h10	SPC_SR_START_RANGE_SMART_WRITE	START RANGE: Smart Write return codes (only when using Smart Write algorithm) SWU-016.1 for exact definitions
6'h3F	SPC_SR_END_RANGE_SMART_WRITE	END RANGE: Smart Write return codes (only when using Smart Write algorithm) SWU-016.1 for exact definitions
6'h20	SPC_SR_PEP_PROGRAM_FAILURE	PEP Program Failure (only when using PEP algorithm): Data Verification Failure (row latch checksum != programmed row checksum)

1.3.174 SPC_CR

SPC Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SPC_CR: 0x40004723

Bits	7	6	5	4	3	2	1	0
SW Access:Reset			NA:0000		R:0	NA:0	NA:0	R/W:0
HW Access			NA		R/W	NA	NA	R/W
Retention			NA		RET	NA	NA	RET
Name			RSVD		SPC_CTRL	RSVD	RSVD	SPC_Manu al_Reset

This register contains control bits for the SPC. This register is reset upon assertion of the SPC_Manual_Reset bit.

Bits	Name	Description
3	SPC_CTRL	This is a status bit that defines which SPC data register (SPC.CPU_DATA or SPC.DMA_DATA) was or is currently being used to send a command to the SPC. When one of the two data registers has the first byte of the SPC 2-byte command key written to it, that register now has temporary control of the SPC. Upon this register write, this bit is set accordingly. All subsequent register writes to the other data register are ignored until the command completes.
0	SPC_Manual_Reset	Setting this bit manually resets the SPC. The SPC hardware automatically clears the bit after being held high for 2 cycles of the AHB Bus Clock.
		See Table 1-103.

Table 1-102. Bit field encoding: SPC_BUSFREQ_ENUM

Value	Name	Description
1'h0	SPC_BUSFREQ_LOW	Tells the SPC that the Bus Clock Frequency is: 50 < Frequency <= 100.
1'h1	SPC_BUSFREQ_HIGH	Tells the SPC that the Bus Clock Frequency is: Frequency <= 50.

Table 1-103. Bit field encoding: SPC_RESET_ENUM

Value	Name	Description
1'h0	SPC_RST_LOW	SPC is in normal execution mode.
1'h1	SPC_RST_HIGH	SPC is in a reset state.

1.3.175 SPC_DMM_MAP_SRAM[0..127]

SPC Direct Memory Mapping

Reset: N/A

Register : Address

SPC_DMM_MAP_SRAM: 0x40004780-0x400047FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	spcsramdata							

Maps one of 5 possible 128-byte pages from the 128-Data Store SRAM or 512-byte Code Store SRAM

Bits	Name	Description
7:0	spcsramdata[7:0]	(no description)

1.3.176   CACHE_CC_CTL

Cache Control Register

Reset: Reset Signals Listed Below

Register : Address

CACHE_CC_CTL: 0x40004800

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:0	NA:00		R/W:0	R:U	R/W:0
HW Access	R		R	NA		R/W	R/W	R/W
Retention	RET		RET	NA		RET	NONRET	RET
Name	FLASH_CYCLES		FLASH_CY CLES_ADD 4	RSVD		FLUSH	FLASH_LO WPWR	ENABLE

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:11111111							
HW Access	R/W							
Retention	RET							
Name	LP_MODE							

CC_CTL is used to configure the behavior of the cache.

Bits	Name	Description
15:8	LP_MODE[7:0]	0x0 - 0xfe: Specifies the number of cache hits after which the cache controller 0xff: Low Power Mode disabled. Assert SLEEP_REQ which will put the FLASH into a low-power mode. To put the FLASH immediately into a low-power state, set LP_MODE to 0. Normally this should only be done when executing code from SRAM.
7:6	FLASH_CYCLES[1:0]	Specifies the number of clock cycles the cache will wait before it samples data coming back from Flash. 0x1: 1 cycle. -> 0 MHz - 16 MHz 0x2: 2 cycles. -> > 16 MHz - 33 MHz 0x3: 3 cycles. -> > 33 MHz - 50 MHz 0x0: 4 cycles. -> > 50 MHz - 67 MHz
5	FLASH_CYCLES_ADD4	Adds 4 extra cycles to the FLASH_CYCLES setting to allow for extra margin and/or for higher frequency binning. 0 = no additional cycles added to FLASH_CYCLES. 1 = 4 extra cycles added to FLASH_CYCLES. The main intention of this bit is to support 80 MHz operation. To do so set FLASH_CYCLES=1 and FLASH_CYLES_ADD4=1 in order to cause the cache to wait 5 cycles before sampling data coming back from Flash. This covers the frequency range: 5 cycles -> > 67 MHz - 83 MHz Operation beyond that is not supported by the chip as a whole.

1.3.176   CACHE_CC_CTL (continued)

2	FLUSH	Writing a 1 will cause the cache to be flushed. All entries in the cache are invalidated on the next clock cycle. Note that invalidating the cache must be done with care as the prefetch logic in the CM3 will have already fetched several instructions before the write to this register is executed. Either a string of NOPs or other special instructions are required to insure data integrity. Reading this bit will always return 0 as the bit is automatically cleared once the cache has been flushed. Also, note the PHUB prefetch buffer is flushed with this bit.
1	FLASH_LOWPWR	0=FLASH is at full power and ready for access. 1=FLASH is in a low-power mode and will take several microseconds on the first access. See the description for LP_MODE for more details on when FLASH is in a low-power mode. Note that this is a read-only bit.
0	ENABLE	0=disable CACHE. 1=enable CACHE.

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	FLASH_LOWPWR
System reset for retention flops [reset_all_retention]	ENABLE, FLUSH, FLASH_CYCLES_ADD4, FLASH_CYCLES[1:0], LP_MODE[7:0]

1.3.177 CACHE_ECC_CORR

Error Correction detected

Reset: Reset Signals Listed Below

Register : Address

CACHE_ECC_CORR: 0x40004880

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000					NA:0	R/W:0	R/W:0
HW Access	R/W					NA	R/W	R/W
Retention	NONRET					NA	RET	NONRET
Name	ECC_ADDR					RSVD	INT_ENB	INT_VALID

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W

HW Access	R/W							
Retention	NONRET							
Name	ECC_ADDR							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ECC_ADDR							

A Single Bit error was detected and corrected. The address where the error occurred is stored in this register. An ECC correction at address 0x1234_5678 would result in this register containing 0x1234_567b. Note that the 3 LSBs have the INT_VALID, INT_ENB and a reserved bit in them. Note that the interrupts from all sources within the cache are logically ORed together. Software must read all of the registers to determine which interrupts have caused the interrupt.

Bits	Name	Description
31:3	ECC_ADDR[28:0]	Flash address where error was detected and corrected. Note that the 3 LSBs are not captured but contain the fields above.
1	INT_ENB	0=Disable interrupt. 1=Enable interrupt on ECC correction. This bit is logically ANDed with INT_VALID before the interrupt is sent to the CPU.

1.3.177   CACHE_ECC_CORR (continued)

| 0 | INT_VALID | 0=ECC_ADDR field is invalid. No ECC correction has occurred. |
| | | 1=ECC_ADDR field contains the address where a single bit error was detected. ECC_ADDR is frozen until INT_VALID is written with a 0. |

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	INT_ENB
Domain reset for non-retention flops [reset_all_nonretention]	INT_VALID, ECC_ADDR[28:0]

1.3.178 CACHE_ECC_ERR

Error Correction failed

Reset: Reset Signals Listed Below

Register : Address

CACHE_ECC_ERR: 0x40004888

Bits	7	6	5	4	3	2	1	0

Retention	NONRET							
Name	HIT_COUNT							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	HIT_COUNT							

This register contains two 16-bit counters which count the number of cache hits and misses. The hit/miss ratio can be used to optimize code performance by analyzing where the code misses cache. When the cache misses, a fetch from FLASH is required which typically takes several wait states. Minimizing the cache misses will improve performance. If excessive cache misses are determined for a particular section of code, the code can either be rewritten to fit better in cache or relocate speed critical code to SRAM. To measure cache perfomance, the HITMISS register should be written with 0 at the start of a block of code to be measured. Then the code is executed and at the end of the code under measurement, the HITMISS register will be read. The cache hit ratio is computed with: hit% = HITMISS[31:16]*100/(HITMISS[31:16]+HITMISS[15:0]; Note that when either the HIT_COUNT or MISS_COUNT register reaches their maximum value, both counters will stop counting. This allows the HIT/MISS ratio to be computed even if there are more than 64K hits/misses from the start of the code to the end. However the computation will only include the first 64K hits or misses from when the counter was zeroed. Often an interrupt service routine can be triggered at regular intervals and measure the hit/miss ratio over time as the code is being executed.

Bits	Name	Description

1.3.180 CACHE_HITMISS (continued)

31:16	HIT_COUNT[15:0]	The HIT_COUNT register operates in 2 modes based on the value in LP_MODE of the cache control register (CC_CTL.LP_MODE). When LP_MODE is 0xff, HIT_COUNT will increment every time cache is able to provide the data to the CPU from it's local copy of the FLASH data (a cache hit). Once the maximum value of either HIT_COUNT or MISS_COUNT is reached, HIT_COUNT will stop counting. Writing a 0 will clear the counter but always write all 32-bits to insure both counters are cleared at the same time. When LP_MODE is any value other than 0xff, the HIT_COUNT is reserved for internal use. HIT_COUNT in this mode is used to keep track of the number of hits from the last MISS. When HIT_COUNT=LP_MODE, then the FLASH is put into a low-power mode until a MISS occurs. Note that HIT_COUNT becomes read-only when LP_MODE!=0xff.
15:0	MISS_COUNT[15:0]	The MISS_COUNT register operates only when LP_MODE is equal to 0xff. The counter is incremented each time the cache controller has to fetch data from FLASH. When either MISS_COUNT or HIT_COUNT reaches the maximum count value of 0xffff, then both counters stop counting. Writing a 0 will clear MISS_COUNT and enable counting.

1.3.181   I2C_XCFG

I2C Extended Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_XCFG: 0x400049C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R:0	R/W:0	NA:000			R/W:0
HW Access	R	R	R/W	R/W	NA			R
Retention	NONRET	NONRET	NONRET	NONRET	NA			NONRET
Name	csr_clk_en	i2c_on	ready_to_sleep	force_nack	RSVD			hw_addr_en

This register configures enhanced features. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Always write reserved bits with a value of '0'.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7	csr_clk_en	This bit is used for gating system clock for the blocks core logic that is not associated with AHB interface. Clock is made available to the core logic only when this bit is set to 1 and the input pin ext_clk_en is also active. If either of them is not active, the blocks core logic does not receive the system clock. See Table 1-104.
6	i2c_on	This bit should be set by the user during initial block configuration if the user wants to use the I2C block as wake-up source. Only when this bit set along with other bits mentioned in the sleep mode section, the I2C wakes up system from sleep on address match.
5	ready_to_sleep	Once the user sets the force_nack bit, the I2C block sets this bit if I2C is not busy or it waits for ongoing transaction to be completed and then sets this bit. As long as this bit is set, the I2C block is going to nack all the transactions.Clearing force_nack bit automatically clears this bit. HW clears this bit automatically on assertion of PD (Power Down)
4	force_nack	This bit must be set by the user before putting the device to sleep and wait for ready_to_sleep status bit to be set. This can be cleared by user by writing '0' and the HW clears it automatically on assertion of PD(Power Down)
0	hw_addr_en	When this bit is set to a '1', hardware address compare is enabled. On an address match, an interrupt is generated, CSR register bit 3 is set, and the clock is stalled until the CPU writes a 0 into the CSR register bit 3. The address is automatically ACKed on a match. On an address mismatch, no interrupt is generated, clock is not stalled, and bit 3 in the CSR register is set. The CPU must write a 0 into the CSR register bit 3 to clear it. The address is automatically NACKed on a mismatch. You must configure the compare address in the ADR register. When this bit is set to a '0', software address compare is enabled. An interrupt is generated, the clock is stalled, and CSR register bit 3 is set when the received address byte is available in the Data register; to enable the CPU to do a firmware address compare. The clock is stalled until the CPU writes a 0 into the CSR register bit 3. The functionality of this bit is independent of the data buffering mode. See Table 1-105.

Table 1-104. Bit field encoding: csr_clk_en_enum

Value	Name	Description

Table 1-104. Bit field encoding: csr_clk_en_enum

| 1'b1 | CSR_CLK_EN | CLK gating for block core logic is enabled |
| 1'b0 | CSR_CLK_DIS | CLK gating for blobk core logic is disabled |

Table 1-105. Bit field encoding: hw_addr_en_enum

Value	Name	Description
1'b1	HW_ADDR_EN	HW Address comparison is enabled
1'b0	HW_ADDR_DIS	HW Address comparison is disabled

1.3.182 I2C_ADR

I2C Slave Adddress Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_ADR: 0x400049CA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0000000						
HW Access	NA	R						
Retention	NA	NONRET						
Name	RSVD	slave_address						

This register holds the slave's 7-bit address. When hardware address compare mode is not enabled in the XCFG register, this register is not in use. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Always write reserved bits with a value of '0'. Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
6:0	slave_address[6:0]	These seven bits hold the slave's own device address. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

1.3.183   I2C_CFG

I2C Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_CFG: 0x400049D6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	NA:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	NA	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NA	NONRET	NONRET	NONRET
Name	sio_select	pselect	bus_error_ie	stop_ie	RSVD	clock_rate	en_mstr	en_slave

This register is used to set the basic operating modes, baud rate, and interrupt selection. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Always write reserved bits with a value of '0'.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7	sio_select	I2C Pin Select for SCL/SDA lines from SIO1/SIO2, 0 = SCL and SDA lines get their inputs from SIO1 module.sclk_str1 and sda_ack1 are driven to SIO1 module and they get asserted once device wakes up from sleep. 1 = SCL and SDA lines get their inputs from SIO2 module. sclk_str2 and sda_ack2 are driven to SIO2 module and they get asserted once device wakes up from sleep. This bit is valid only when I2C.CFG[6] is asserted.
		See Table 1-111.
6	pselect	I2C Pin Select for SCL/SDA lines from GPIO/SIO, 0 = SCL and SDA lines get their inputs from GPIO module.sclk_str0 and sda_ack0 are driven to GPIO module and they get asserted once device wakes up from sleep. 1 = SCL and SDA lines get their inputs from one of the SIO Blocks that is chosen based on the configuration of bit I2C.CFG[7]
		See Table 1-110.
5	bus_error_ie	Bus Error Interrupt Enable 0 disabled 1 enabled. An interrupt is generated on the detection of a Bus error condition.
		See Table 1-106.
4	stop_ie	Stop Interrupt Enable 0 disabled 1 enabled. An interrupt is generated on the detection of a Stop condition.
		See Table 1-112.
2	clock_rate	0 Samples/bit is 16, 1 Samples/bit is 32
		See Table 1-107.
1	en_mstr	0 Disabled 1 enabled
		See Table 1-108.
0	en_slave	0 Disabled 1 enabled
		See Table 1-109.

1.3.184 I2C_CSR

I2C Control and Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_CSR: 0x400049D7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WZC:0	R/W:0	R/WZC:0	R/W:0	R/WZC:0	R/W:0	R/WZC:0	R/WZC:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	bus_error	lost_arb	stop_status	ack	address	transmit	lrb	byte_complete

This register is used by the slave to control the flow of data bytes and to keep track of the bus state during a transfer. Bits in this register are held in reset until one of the enable bits in CFG is set. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'. Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7	bus_error	0 Status bit. It must be cleared by firmware by writing a '0' to the bit position. It is never cleared by the hardware. 1 a misplaced Start or Stop condition was detected. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
6	lost_arb	0 This bit is set immediately on lost arbitration; however, it does not cause an interrupt. This status may be checked after the following Byte Complete interrupt. Any Start detect or a write to the Start or Restart generate bits (MCSR register), when operating in Master mode, will also clear the bit. 1 lost Arbitration. This bit is held zero if I2C_CFG.en_mstr is zero.
5	stop_status	0 Status bit. It must be cleared by firmware with write of '0' to the bit position. It is never cleared by the hardware. 1 a Stop condition was detected. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
4	ack	Acknowledge Out. Bit is automatically cleared by hardware on a Byte Complete event. 0 nack the last received byte. 1 ack the last received byte
3	address	0 Status bit. It must be cleared by firmware with write of '0' to the bit position. 1 the received byte is a slave address. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
2	transmit	Bit is set by firmware to define the direction of the byte transfer. Any Start detect will clear the bit. 0 receive mode 1 transmit mode. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero. See Table 1-113.
1	lrb	Last Received Bit. The value of the 9th bit in a Transmit sequence, which is the acknowledge bit from the receiver. Any Start detect or a write to the Start or Restart generate bits, when operating in Master mode, will also clear the bit. 0 last transmitted byte was ACK'ed by the receiver. 1 last transmitted byte was NACK'ed by the receiver. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

1.3.184 I2C_CSR (continued)

| 0 | byte_complete | Transmit/Receive Mode: 0 no completed transmit/receive since last cleared by firmware. Any Start detect or a write to the start or Restart generate bits, when operating in Master mode, will also clear the bit. Transmit mode: 1 eight bits of data have been transmitted and an ACK or NACK has been received. Receive mode: 1 eight bits of data have been received. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero. |

Table 1-113. Bit field encoding: transmit_enum

Value	Name	Description
1'b1	TRANSMIT_EN	Bytes are transferred from the device
1'b0	TRANSMIT_DIS	Bytes are received from the device

1.3.185   I2C_D

I2C Data Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_D: 0x400049D8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	data							

This register provides read/write access to the Shift register. This register is read only for received data and write only for transmitted data.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7:0	data[7:0]	Read received data or write data to transmit. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

1.3.186   I2C_MCSR

I2C Master Control and Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_MCSR: 0x400049D9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R:0	R:0	R/W:0	R/W:0
HW Access	NA			R/W	R/W	R/W	R/W	R/W
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			stop_gen	bus_busy	master_mode	restart_gen	start_gen

This register implements I2C framing controls and provides Bus Busy status. Bits in this register are held in reset until one of the enable bits in CFG is set. In the table above, note that reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
4	stop_gen	This bit is set only for master transmitter and used at the end of byte transfer. After byte complete status is set, if this bit is set followed by the Transmit bit in I2C.CSR register, Stop condition is generated after byte complete. This bit is automatically reset to 0 after the Stop, start or Restart has been generated. During data phase, if Stop Gen bit is set to 0, clearing the Transmit bit in I2C.CSR register will also generate a Stop condition. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
3	bus_busy	This bit is set to the following. 0 when a Stop condition is detected (from any bus master). 1 when a Start condition is detected (from any bus master). This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
2	master_mode	This bit is set/cleared by hardware when the device is operating as a master. 0 stop condition detected, generated by this device. 1 start condition detected, generated by this device. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
1	restart_gen	This bit is cleared by hardware when the Restart generation is complete. 0 restart generation complete. 1 generate a Restart condition. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.
0	start_gen	This bit is cleared by hardware when the Start generation is complete. 0 start generation complete. 1 generate a Start condition and send a byte (address) to the I2C bus, if bus is not busy. This bit is held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

1.3.187 I2C_CLK_DIV1

I2C Clock Divide Factor Register-1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_CLK_DIV1: 0x400049DB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	divide_factor_1							

This register has the 8 LSB bits of the 10-bit Clock Divider.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7:0	divide_factor_1[7:0]	The configuration of this register along with that in register CLK_DIV2 defines the factor by which the SYSCLK will be divided in the I2C block. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

1.3.188   I2C_CLK_DIV2

I2C Clock Divide Factor Register-2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_CLK_DIV2: 0x400049DC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						NONRET	
Name	RSVD						divide_factor_2	

This register has the 2 MSB bits of the 10-bit Clock Divider.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
1:0	divide_factor_2[1:0]	The configuration of this register along with that in register CLK_DIV1 defines the factor by which the SYSCLK will be divided in the I2C block. These bits are held zero if I2C_CFG.en_mstr and I2C_CFG.en_slave are both zero.

1.3.189   I2C_TMOUT_CSR

I2C TIMEOUT CSR.

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_TMOUT_CSR: 0x400049DD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:000			R:1	R:1	R/W:0	R/W:0	R/W:0
HW Access	R			R/W	R/W	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			sda_pin_status	scl_pin_status	i2c_timeout_int_enable	i2c_sda_timeout_enable	i2c_scl_timeout_enable

I2C TIMEOUT Configuration and Status Register.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7:5	RSVD[2:0]	Reserved
4	sda_pin_status	SDA Line status
3	scl_pin_status	SCL Line status
2	i2c_timeout_int_enable	I2C Timeout interrupt enable
1	i2c_sda_timeout_enable	I2C SDA Timeout enable
0	i2c_scl_timeout_enable	I2C SCL Timeout enable

1.3.190   I2C_TMOUT_SR

I2C TIMEOUT SR.

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_TMOUT_SR: 0x400049DE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:000000						R/WOC:0	R/WOC:0
HW Access	R						R/W	R/W
Retention	NA						NONRET	NONRET
Name	RSVD						sda_tmout_status	scl_tmout_status

I2C TIMEOUT status for SCL, SDA lines Register.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7:2	RSVD[5:0]	Reserved
1	sda_tmout_status	SDA Timeout status
0	scl_tmout_status	SCL Timeout status

1.3.191 I2C_TMOUT_CFG0

I2C TIMEOUT Period Configuration

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_TMOUT_CFG0: 0x400049DF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:11111111							
HW Access	R							
Retention	NONRET							
Name	timeout_period_lowbyte							

I2C TIMEOUT period configuration period Lower Byte register.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7:0	timeout_period_lowbyte[7:0]	SCL Timeout status

1.3.192   I2C_TMOUT_CFG1

I2C TIMEOUT Period Configuration

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

I2C_TMOUT_CFG1: 0x400049E0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0000				R/W:1111			
HW Access	R				R			
Retention	NA				NONRET			
Name	RSVD				timeout_period_highnibble			

I2C TIMEOUT period configuration period Higher Nibble register.   Note this register is on reset_all_nonretention by default. However, if PWRSYS.CR1.i2creg_backup = 1 then this register is effectively on reset_all_retention.

Bits	Name	Description
7:4	RSVD[3:0]	Reserved
3:0	timeout_period_highnibble [3:0]	SCL Timeout status

1.3.193 DEC_CR

Decimator Control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DEC_CR: 0x40004E00

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:00		R/W:0	R/W:0
HW Access	R	R	R	R	R		R	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET		NONRET	NONRET
Name	sat_en	fir_en	ocor_en	gcor_en	conv_mode		xstart_en	start_conv

This register provides information about start, stop, mode, and feature enables. A read of this register produces the last value written to this register with the exception of bit 0. If a 1 is read from bit 0 and conv_mode doesn't = 00 this indicates the filter is running. If a 0 is read and conv_mode doesn't = 00 the block is in the standby state. If conv_mode = 00 bit 0 has no meaning and could be 1 or 0.

Bits	Name	Description
7	sat_en	Controls saturation logic in the Post Processing filter. When enabled, the resulting outputs of the Post Processing filter are held to the most positive or negative values, rather then wrapping around. Conversion results are unpredictable if this bit is changed while the Post Processing filter is running. This bit is ignored if FIR_EN, OCOR_EN and GCOR_EN are all 0. This feature is used to prevent wrap-around if the Decimator is mis-configured when using the Post Processor. NOTE: This is different from the Overflow Correction described in DR2H See Table 1-118.
6	fir_en	Controls whether or not Post Processing filter implements a FIR filter. If this bit is set it enables the Post Processing filter. Conversion results are unpredictable if this bit is changed while the filter is running. The decimation period of this filter is controlled by the DR2 bits in register DR2 and DR2H. See Table 1-115.
5	ocor_en	This bit controls the offset correction feature of the Post Processing filter. If this bit is set it enables the Post Processing filter. The offset value is programmed in the OCOR bits of registers OCOR, OCORM and OCORH. Conversion results are unpredictable if this bit is changed while the filter is running. See Table 1-117.
4	gcor_en	This bit controls the gain correction feature of the Post Processing filter. If this bit is set it enables the Post Processing filter. The gain coefficient is programmed in the GCOR bits of registers GCOR and GCORH. Which bits in this 16-bit field that are valid is set in GVAL. Conversion results are unpredictable if this bit is changed while the filter is running. When this feature is enabled, the DR1 register field must be set to a value higher than 32 (worst case) for proper operation. See the DR1 register definition of cases where values less than 32 are allowed. See Table 1-116.

1.3.193 DEC_CR (continued)

3:2	conv_mode[1:0]	The value in these two bits controls the sampling mode the Decimator runs in. Single Sample mode resets all values in the ADC path, captures one sample (4 decimation cycles) and returns to the Standby state. Fast Filter mode is a continuous running Single Sample mode - the ADC path being reset between each sample. Continuous mode resets the ADC path, generates a sample and then without resetting the ADC path, generates a new sample every decimation cycle thereafter. Fast FIR mode is the same as the Continuous mode except it resets the ADC channel and starts again at the termination of the DR2 (FIR Filter) period. If Fast FIR mode is selected and FIR Enable is not set in bit 6, Fast FIR and Continuous mode function the same. Conversion results are unpredictable if these bits are changed while the filter is running.

See Table 1-114.

1	xstart_en	Controls whether DSI signal ext_start is active. If XSTART_EN is high, it allows the ext_start input to start a conversion just as START_CONV does. Regardless of the state of this bit, writing to START_CONV will start a conversion.

See Table 1-120.

0	start_conv	A write of 1 to this bit starts a conversion (regardless of the state of XSTART_EN) according to the CONV_MODE set in bits 2, 3. If read, a 1 indicates the filter is running when not in Single Sample mode. If a 0 is read the block is in the standby state when not in Single Sample mode. When in Single Sample more this bit is cleared shortly after it is written and does not reflect the running state of the Decimator. If the Decimator is running in Single Sample Mode and this bit is written with a 1 the conversion start is queued, and will start then the previous one completes. If a 1 is read from this bit when in Single Sample Mode it indicates a conversion start is queued. Note that the other bits of this CSR are not queued so queued SS Mode starts must set the same bits in this register as the conversion running. If 0 is written to this bit, it forces the block into the Standby start via a soft-reset. This soft-reset works in any mode and at any time and takes a minimum of 1 and maximum of 2 adc_clk cycles to complete. If a 1 is written before the soft-reset has completed, the start is queued and the conversion will start when the soft-reset is complete.

See Table 1-119.

Table 1-114. Bit field encoding: conv_modes_enum

Value	Name	Description
2'b00	SINGLE_SAMPLE	Single Sample Mode.
2'b01	FAST_FILTER	Fast Filter Mode.
2'b10	CONTINUOUS	Continuous Mode.
2'b11	FAST_FIR	Fast FIR.

Table 1-115. Bit field encoding: fir_en_enum

Value	Name	Description
1'b1	FIR_EN	FIR filter function is on.
1'b0	FIR_DIS	FIR filter function disabled.

Table 1-116. Bit field encoding: gcor_en_enum

Value	Name	Description
1'b1	GCOR_EN	Gain correction enabled.
1'b0	GCOR_DIS	Default: no gain correction.

Table 1-117. Bit field encoding: ocor_en_enum

Value	Name	Description
1'b1	OCOR_EN	Offset correction enabled.
1'b0	OCOR_DIS	No offset correction.

Table 1-118. Bit field encoding: sat_en_enum

Value	Name	Description
1'b1	SAT_EN	Saturation Control Enabled.
1'b0	SAT_DIS	No saturation control.

1.3.193   DEC_CR (continued)

Table 1-119. Bit field encoding: start_conv_enum

Value	Name	Description
1'b1	DEC_START	Initiate a conversion.
1'b0	DEC_STOP	Kill current conversion (if running) and enter Standby state (SW reset).

Table 1-120. Bit field encoding: xstart_en_enum

Value	Name	Description
1'b1	XSTART_EN	Enable the DSI input signal ext_start to start a conversion.
1'b0	XSTART_DIS	Default: DSI signal ext_start is disabled.

1.3.194   DEC_SR

Decimator Status Register

Reset: Reset Signals Listed Below

Register : Address

DEC_SR: 0x40004E01

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	W:0	R/W:0	R:0
HW Access	NA		R	R	R	R	R	R/W
Retention	NA		RET	RET	RET	NONRET	RET	NONRET
Name	RSVD		coreclk_disable	intr_pulse	out_align	intr_clr	intr_mask	conv_done

This register provides information about interrupt, polling, status, and control features.

Bits	Name	Description
5	coreclk_disable	This bit when set high disables (gates off) the clock to the entire core of the block (adc_clk). This includes all FFs except those used for the AHB interface and CSRs. When disabled (set high) the AHB interface to the CSR is still fully functional. This bit is ANDed with the primary input signal cic_clk_en to control the clock gate. cic_clk_en must be high and CoreCLK_Disable must be low for the clock to run.
		See Table 1-122.
4	intr_pulse	This read/write bit selects if cic_intr is pulse or level sensed. If level, a sample completion sets cic_intr high where it remains until bit 2 is written, a soft-reset if performed or if OUTSAMP/M/H is read. If pulse, a single cycle (pclk) strobe is generated on cic_intr to be used as an edge sensed interrupt or a DMAREQ. Regardless of which is selected, the interrupt output is still subject to masking by bit 1.
		See Table 1-125.
3	out_align	This bit when set high causes a read of OUTSAMP to produce the contents of OUTSAMPM and OUTSAMPM to produce the contents of OUTSAMPH. Effectively, this is an 8-bit right shift of the result. Note that the setting of this bit does not alter the content of the OUTSAMP registers. Setting this bit simply realigns the byte lanes when the register is read. If this bit is set low, the OUTSAMP registers are read normally. This feature is added to allow the SW to read 9 to 16 bit samples from the Decimator in one cycle on bits 15:0. Note also that when using Coherency checking in conjunction with this alignment feature that the Key Coherency Byte selected in the COHER register is referenced based on the address of the register being read, not the content delivered on the bus. This means that if this bit is set high with the intent to read sample data 23:8 on 15:0 that they Key Coherency Byte should be set to either OUTSAMP or OUTSAMPM, not OUTSAMPH.
		See Table 1-126.
2	intr_clr	INTR_CLR is a write-only bit that clears bit0 and cic_intr. A read always produces a 0.
		See Table 1-123.
1	intr_mask	INTR_MASK is a RD/WR bit that controls the generation of the conversion completion interrupt. A read produces that last value written to this bit. This bit functions as a mask regardless of the value of bit 4 (INTR PULSE).
		See Table 1-124.

1.3.194   DEC_SR (continued)

| 0 | conv_done | CONV_DONE is a read-only bit indicating that the most recently started conversion has completed if it has been cleared since the last sample read. This same bit is the interrupt signal cic_intr when bit 4 is low, if not masked by bit 1. This bit is intended to provide a polling mechanism should this be preferred to receiving interrupts. It is cleared by writing a 1 to bit 2, a soft-reset or a read of register OUTSAMP, OUTSAMPM or OUTSAMPH (regardless of Coherency settings). |

See Table 1-121.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	intr_mask, out_align, intr_pulse, coreclk_disable
Domain reset for non-retention flops [reset_all_nonretention]	conv_done, intr_clr

Table 1-121. Bit field encoding: conv_done_enum

Value	Name	Description
1'b1	CONV_COMP	Most recently started conversion completed.
1'b0	CONV_NOTCOMP	Conversion not completed since last clear.

Table 1-122. Bit field encoding: coreclk_disable_enum

Value	Name	Description
1'b1	CORECLK_DISABLE_HIGH	Core Clock is Disabled
1'b0	CORECLK_DISABLE_LOW	Core Clock is Enabled

Table 1-123. Bit field encoding: intr_clr_enum

Value	Name	Description
1'b1	INTR_CLEAR	Clears CONV_DONE and the interrupt on cic_intr (if enabled).
1'b0	INTR_NOP	No affect.

Table 1-124. Bit field encoding: intr_mask_enum

Value	Name	Description
1'b1	INTR_MASKED	Masks the interrupt generation on cic_intr.
1'b0	INTR_ENABLED	Allows CONV_DONE to generate an interrupt.

Table 1-125. Bit field encoding: intr_pulse_enum

Value	Name	Description
1'b1	INTR_PULSE	Selects a pulse interrupt on cic_intr.
1'b0	INTR_LEVEL	Selects a level interrupt on cic_intr.

Table 1-126. Bit field encoding: out_align_enum

Value	Name	Description
1'b1	OUT_ALIGN_HIGH	Shifts SAMP registers right by 8-bits
1'b0	OUT_ALIGN_LOW	No affect on SAMP Registers

1.3.195   DEC_SHIFT1

Decimator Shifter 1 (Input)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_SHIFT1: 0x40004E02

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:00000				
HW Access	NA			R				
Retention	NA			RET				
Name	RSVD			shift1				

This register provides control information to the input (left) shifter. SHIFT1 is a 5-bit field that sets the amount of left shift that the Modulator input will be shifted. Disturbing this field during a conversion will disturb the output value. This register should only be updated while the CIC filter is in the Standby state. Conversion results are unpredictable if these bits are changed while the filter is running. Not all values from 0 to 31 make computational sense. A read of this register produces the last value written to this register.

Bits	Name	Description
4:0	shift1[4:0]	Value for left shift amount of modulator input data. 0 = no shift, 1 = left shift by 1 bit, ... up to the max supported 31.

1.3.196 DEC_SHIFT2

Decimator Shifter 2 (Output)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_SHIFT2: 0x40004E03

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				shift2			

This register provides control of the post CIC (output) shifter. This shifter sits at the input of the Post Processor and is only functional on the CIC output sample when the Post Processor is in use. SHIFT2 is a 4-bit field that sets the amount of right shift on the output of the CIC filter as it enters the Post Processor. Changing this field during a conversion will disrupt the output value. Conversion results are unpredictable if these bits are changed while the filter is running. Shift2 shifts right by the amount held in this register. Not all values from 0 to 15 make computational sense. A read of this register produces the last value written to this register.

Bits	Name	Description
3:0	shift2[3:0]	Value for the amount of right shift for the output of the CIC filter prior to entering the Post Processor. Functional values range from 0 to 15, 0 = no shift.

1.3.197   DEC_DR2

Decimator Decimation Rate (2)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_DR2: 0x40004E04

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dr2_low							

This register provides information to the Post Processor about the decimation rate of the FIR filter. This is a 10-bit field that sets the decimation ratio in the Post Processing filter. The upper 2 bits are found in register DR2H. The decimation ratio minus 1 in binary is the number to program in this 10-bit field. Valid decimation ratios are 2 to 1024. Changing this field during a conversion will disrupt the output value. Conversion results are unpredictable if these bits are changed while the filter is running. A read of this register produces the last value written to this register.

Bits	Name	Description
7:0	dr2_low[7:0]	FIR Filter decimation ratio bits [7:0] (of [9:0]).

1.3.198   DEC_DR2H

Decimator Decimation Rate (2) and Overflow Correction

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_DR2H: 0x40004E05

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000					NA:0	R/W:00	
HW Access	R					NA	R	
Retention	RET					NA	RET	
Name	of_width					RSVD	dr2_high	

This register provides information to the Post Processor about the decimation rate of the FIR filter. This is a 10-bit field that sets the decimation ratio in the Post Processing filter. The lower 8 bits are found in register DR2. The decimation ratio minus 1 in binary is the number to program in this 10-bit field. Valid decimation ratios are 2 to 1024. The OverFlow Correction Width field is used to correct for 2's compliment overflow in output results. For n bit results the CIC filter will create a maximum number of $+2^n$ (for positive ranges) or $+2^{(n-1)}$ (for signed ranges) which both need (n+1) bits to represent. When read truncated to n bits this produces errors in the output range. This field allows SW to program a reference to the size of n and where the n bits are in the output register and it controls correction HW that clamps the output value to $+2^{n-1}$ and $+2^{(n-1)}-1$, respectively. Changing either of the fields in this register during a conversion will disrupt the output value. Conversion results are unpredictable if this register is changed while the Decimator is running. A read of this register produces the last value written to this register.

Bits	Name	Description
7:3	of_width[4:0]	Occupying the top 5 bits of this register is the Overflow Correction Bit-Width field (it is unrelated to the DR2). This field both enables and sets the bit width of the Overflow Correction logic in the CIC core. With n = number of bits in the sample SW will read from OUTSAMP, the following formula gives the value to program into OF_WIDTH: OF_WIDTH = n-1+s (for signed ranges), OF_WIDTH = n+s (for positive ranges) -- where s = the number of bit positions the result field is left-shifted from the lsb of the OUTSAMP register. Examples: For an 8-bit result that is lsb aligned in OUTSAMP and is signed, n=8, s=0 so: OF_WIDTH = 8-1+0 = 7. For an 8-bit result that is lsb aligned in OUTSAMP and is a positive range: OF_WIDTH = 8+0 = 8. For a signed 12-bit result that is shifted into the high two bytes: OF_WIDTH = 12-1+8 = 19. Functional values of OF_WIDTH are 5 to 22 (6 to 23-bit numbers). Any other value in this field disables the Overflow Correction feature and data is not altered when passing through the Overflow Correction logic. Overflow Correction only works on positive numbers. Example: If OF_WIDTH is set to 7 (for an 8-bit signed value) and given a range of -144 to 144, the 144 will get truncated to 127 but the -144 will not get truncated.
1:0	dr2_high[1:0]	FIR Filter decimation ratio bits [9:8] (of [9:0]). See description in DR2 register

1.3.199 DEC_DR1

Decimator Decimation Rate (1) of CIC Filter

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_DR1: 0x40004E06

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dr1							

DR1 is an 8-bit field that sets the decimation ratio in the CIC filter. The decimation ratio minus 1 in binary is the number to program in this register. Valid decimation ratios are any value in the range 2 to 256 (program 1-255) for all modes where the Post Processor is not in use. Note this does not mean the results will be valid. For higher levels of input data (moddat), higher DR1 values will saturate the CIC filter and give meaningless results. This is true for any of the 4 modes Single Sample, Continuous, Fast Filter or Fast FIR. Because the Post Processor needs time to perform its enabled calculations, the minimum DR1 for cases where the Post Process is enabled are greater and are a function of what Post Processing features are enabled. These restrictions also apply to SS Mode if started back-to-back or queued. Minimum DR1 values for each are given as: Offset Correction: DR1 >= 4, FIR (Sync1): DR1 >= 4, Both Offset and FIR: DR1 >= 5, Gain Correction: DR1 >= GVAL + 5, Gain and Offset: DR1 >= GVAL + 6, Gain and FIR: DR1 >= GVAL + 6, Gain and Offset and FIR: DR1 >= GVAL + 7, (where GVAL is the 0-based value programmed into the register). Changing this field during a conversion will disrupt the output value. Conversion results are unpredictable if these bits are changed while the filter is running.

Bits	Name	Description
7:0	dr1[7:0]	CIC Filter decimation rate.

1.3.200   DEC_OCOR

Decimator Offset Correction Coefficient (Low Byte)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_OCOR: 0x40004E08

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ocor_low							

OCOR / OCORM / OCORH is a 24-bit 2's compliment signed field that is the offset correction value used if the Post Processor Offset feature is enabled. The field is specified in registers OCOR, OCORM, and OCORH. This register may be written while the filter is running. OCOR, OCORM and OCORH can be coherency interlocked (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the Offset field is written the field is flagged incoherent until the Key Coherency Byte is written. Once the Key Coherency Byte is written the field is flagged coherent again. When not coherent, the HW will not pass any portion of the 24-bit number to the Post Processor. When incoherent, the previous Offset value is used. A new Offset value is accepted when a write to the Key Coherency Byte is seen - as defined in the COHER register. The 3 bytes of the Offset field may be written in any order but the Key Coherency Byte must be written last.

Bits	Name	Description
7:0	ocor_low[7:0]	Offset correction coefficient bits [7:0] (of [23:0]).

1.3.201 DEC_OCORM

Decimator Offset Correction Coefficient (Middle Byte)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_OCORM: 0x40004E09

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ocor_mid							

See descripion in OCOR register above.

Bits	Name	Description
7:0	ocor_mid[7:0]	Offset correction coefficient bits [15:8] (of [23:0]).

1.3.202　DEC_OCORH

Decimator Offset Correction Coefficient (High Byte)

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

DEC_OCORH: 0x40004E0A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ocor_high							

See description in OCOR register above.

Bits	Name	Description
7:0	ocor_high[7:0]	Offset correction coefficient bits [23:16] (of [23:0]).

1.3.203 DEC_GCOR

Decimator Gain Correction Coefficient (Low Byte)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_GCOR: 0x40004E0C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	gcor_low							

GCOR / GCORH is a 16-bit field that is the gain correction value for the Post Processor. The field is specified in registers GCOR and GCORH. This register may be written while the filter is running. If a multiply is in progress, updates to the gain correction value will be ignored until the start of the next multiply. Which bits that are valid in the 16 bit field is signified in the GVAL register. The implementation in HW is a shift_add multiply which consumes a clock cycle (adc_clk) for each valid bit in the GCOR field as defined by GVAL. GCOR, GCORH and GVAL can be coherency interlocked (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the Gain/Gain_Value field is written the field is flagged incoherent until the Key Coherency Byte is written. Once the Key Coherency Byte is written the field is flagged coherent again. When not coherent, the HW will not pass any portion of the 16-bit Gain number or 8-bit Gain Value to the Post Processor. When incoherent, the previous written values are used. A new Gain/Gain_Value is accepted when a write to the Key Coherency Byte is seen - as defined in the COHER register. The 3 bytes of the Gain/Gain_Value field may be written in any order but the Key Coherency Byte must be written last. READ: A read of this register produces the last value written to this register. Reads have no affect on coherency flags.

Bits	Name	Description
7:0	gcor_low[7:0]	Gain correction coefficient bits [7:0] (of [15:0]).

1.3.204 DEC_GCORH

Decimator Gain Correction Coefficient (High Byte)

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_GCORH: 0x40004E0D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	gcor_high							

Seed description of GCOR register above.

Bits	Name	Description
7:0	gcor_high[7:0]	Gain correction coefficient bits [15:8] (of [15:0]).

1.3.205 DEC_GVAL

Decimator Gain Correction Size Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_GVAL: 0x40004E0E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				gval			

GVAL is a 4-bit field that signifies to the HW how many bits of GCOR field are valid. The number of valid bits minus one should be written (0000b = 1 bit, 1111b = all 16 bits). Updates to this register will be ignored until the start of the next multiply. This register may be written while the filter is running. The valid field is measured from LSB (bit 0) up. Note that the HW always assumes the field specified by GVAL is left justified (starts at bit 0 of GCOR) and has a binary-point after the left-most digit. For example, if GVAL is programmed with a 7d, this means there are 8 valid bits in GCOR and they have the format x.xxxxxxxb. If GCOR (GCORH, GCOR) holds the value 00000000 10100000b and GVAL is 7, only the low-order 8 bits are considered (10100000b) and the binary point is assumed after the left-most digit (1.0100000b). The multiply coefficient in the example would be 1.25d. Although a good explanation example, this isn't the most efficient way to multiply by 1.25d. Better would be GCOR (GCORH, GCOR) holds the value 00000000 00000101b and GVAL is 2, which gives (1.01b). Another example: If it is desired to multiply by a gain coefficient of 0.125d (0.001b) then GCOR would be programmed with a value of 00000001b, GCORH with 00000000b and GVAL (GVAL) with 0011b - meaning there are 4 valid bits x.xxxb. The multiplier thus has a coefficient range of $1/(2^{15})$ to $2.0-(1/(2^{15}))$ in steps of $1/(2^{15})$ GCOR, GCORH and GVAL can be coherency interlocked (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the Gain/Gain_Value field is written the field is flagged incoherent until the Key Coherency Byte is written. Once the Key Coherency Byte is written the field is flagged coherent again. When not coherent, the HW will not pass any portion of the 16-bit Gain number or 8-bit Gain Value to the Post Processor. When incoherent, the previous written values are used. A new Gain/Gain_Value is accepted when a write to the Key Coherency Byte is seen - as defined in the COHER register. The 3 bytes of the Gain/Gain_Value field may be written in any order but the Key Coherency Byte must be written last. READ: A read of this register produces the last value written to this register. Reads have no affect on coherency flags.

Bits	Name	Description
3:0	gval[3:0]	Number of valid bits minus one in Gain Coefficient registers GCORH and GCOR.

1.3.206 DEC_OUTSAMP

Decimator Output Data Sample (Low Byte)

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DEC_OUTSAMP: 0x40004E10

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	samp_low							

This register is read-only and contains the low order byte of the conversion result. In some configurations of the block the output results of interest are placed in bits 23:8 of the output sample field. To allow reading such values in one bus cycle an alignment feature is added to shift the result right by 8-bits. This feature is enabled by the OUTPUT_ALIGN bit of the SR register. This register can be coherency interlock protected (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the OUTSAMP / OUTSAMPM / OUTSAMPH field is read the field is flagged incoherent until the Key Coherency Byte is read. Once the Key Coherency Byte is read the field is flagged coherent again. When the Decimator generates a new sample and the output sample field is coherent, the output sample field is over-written with the new value - regardless of whether it had been read prior or not. If the output sample field is flagged incoherent when the new sample is generated, the new sample is lost and the output sample field is left untouched. There is no warning given when either a new sample is lost or an unread output sample is overwritten. WRITE: This register is read-only - writes to this address complete but have no affect.

Bits	Name	Description
7:0	samp_low[7:0]	Low order byte of the filter conversion result, bits [7:0] (of [23:0]) --- Or if the out_align bit is set it contains bits [15:8] (of [23:0]).

1.3.207 DEC_OUTSAMPM

Decimator Output Data Sample (Middle Byte)

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DEC_OUTSAMPM: 0x40004E11

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	samp_middle							

This register is read-only and contains the middle order byte of the conversion result. In some configurations of the block the output results of interest are placed in bits 23:8 of the output sample field. To allow reading such values in one bus cycle an alignment feature is added to shift the result right by 8-bits. This feature is enabled by the OUTPUT_ALIGN bit of the SR register. This register can be coherency interlock protected (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the OUTSAMP / OUTSAMPM / OUTSAMPH field is read the field is flagged incoherent until the Key Coherency Byte is read. Once the Key Coherency Byte is read the field is flagged coherent again. When the Decimator generates a new sample and the output sample field is coherent, the output sample field is over-written with the new value - regardless of whether it had been read prior or not. If the output sample field is flagged incoherent when the new sample is generated, the new sample is lost and the output sample field is left untouched. There is no warning given when either a new sample is lost or an unread output sample is overwritten. WRITE: This register is read-only - writes to this address complete but have no affect.

Bits	Name	Description
7:0	samp_middle[7:0]	Middle order byte of the filter conversion result, bits [15:8] (of [23:0]) --- Or if the out_align bit is set it contains bits [23:16] (of [23:0]).

1.3.208   DEC_OUTSAMPH

Decimator Output Data Sample (High Byte)

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DEC_OUTSAMPH: 0x40004E12

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	samp_high							

This register is read-only and contains the high order byte of the conversion result. This register can be coherency interlock protected (selectable in the COHER register). A Key Coherency Byte can be defined in the COHER register. If any byte of the OUTSAMP / OUTSAMPM / OUTSAMPH field is read the field is flagged incoherent until the Key Coherency Byte is read. Once the Key Coherency Byte is read the field is flagged coherent again. When the Decimator generates a new sample and the output sample field is coherent, the output sample field is over-written with the new value - regardless of whether it had been read prior or not. If the output sample field is flagged incoherent when the new sample is generated, the new sample is lost and the output sample field is left untouched. There is no warning given when either a new sample is lost or an unread output sample is overwritten. Note that even though there is no register defined for the high byte (address xx13) of this register, if this register is read as a 16-bit access the top byte will contain the sign extension. WRITE: This register is read-only - writes to this address complete but have no affect.

Bits	Name	Description
7:0	samp_high[7:0]	High order byte of the filter conversion result, bits [23:16] (of [23:0]).

1.3.209 DEC_OUTSAMPS

Decimator Output Data Sample (Sign Extension)

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DEC_OUTSAMPS: 0x40004E13

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	samp_signext							

* This is a pseudo register. There are no FFs or even an address decode for this pseudo register. If read or written as a byte it acts the same as all other unused byte addresses in the block's address space - writes are ignored and reads produce 0 on the bus. However, if OUTSAMPH is read as a 16-bit value, it is sign extended onto the bus on these 8 bits. This pseudo register definition is here simply to document this sign extension functionality. WRITE: This register is read-only - writes to this address complete but have no affect. If read as a byte, it always returns 0. If read as the high byte of a 16-bit read of OUTSAMPH, it always returns the sign extension of the value in OUTSAMP/M/H.

Bits	Name	Description
7:0	samp_signext[7:0]	Sign extension of the value held in OUTSAMP.

1.3.210 DEC_COHER

Decimator Coherency Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DEC_COHER: 0x40004E14

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:00		R/W:00		R/W:00	
HW Access	NA		R		R		R	
Retention	NA		RET		RET		RET	
Name	RSVD		gcor_key		ocor_key		samp_key	

The three 2-bit fields of this register are used to select which of the 3 bytes (of the OCOR, GCOR/GVAL and OUTSAMP fields) will be used as the Key Coherency Byte (KCB). Or, if no coherency checking is desired, to turn it off. The KCB selected is SW's way of tell the HW which byte of the 3-byte field it will access to signify the completion of a coherent operation. For the OCOR and GCOR/GVAL 3-byte fields, selecting the key byte tells the HW which of the bytes it will write last to note that all of the bytes it wants to update have been written. When any non-Key byte is written, the coherency HW locks the underlying ALU hardware from seeing the potentially incoherent value. While incoherent the ALU uses a shadow copy of the last coherent value received. The SW lastly writes the KCB and the HW flags the field as coherent and the next ALU operation needing that coefficient will get a copy of the newly written value. The OUTSAMP field is basically the same other than it's a read only register and the coherency protects the output sample from being overwritten by a subsequent sample if the present sample is in the process of being read (this is technically an overrun condition). If no byte of the previous sample has been read, a new sample will overwrite the last. If the previous sample is in the process of being read, a new sample will be dropped. Coherency doesn't protect againt over/under flow, it only makes sure the sample read is coherent.

Bits	Name	Description
5:4	gcor_key[1:0]	Sets the Key Coherency Byte of the GCOR/GCORH/GVAL field
		See Table 1-127.
3:2	ocor_key[1:0]	Sets the Key Coherency Byte of the OCOR/OCORM/OCORH field
		See Table 1-128.
1:0	samp_key[1:0]	Sets the Key Coherency Byte of the OUTSAMP/OUTSAMPM/OUTSAMPH field
		See Table 1-129.

Table 1-127. Bit field encoding: gcor_key_enum

Value	Name	Description
2'b00	GCOR_KEY_OFF	Gain Coefficient Coherency checking off.
2'b01	GCOR_KEY_LOW	Key Byte is low byte (GCOR).
2'b10	GCOR_KEY_MID	Key Byte is med byte (GCORH).
2'b11	GCOR_KEY_HIGH	Key Byte is high byte (GVAL).

Table 1-128. Bit field encoding: ocor_key_enum

Value	Name	Description
2'b00	OCOR_KEY_OFF	Offset Coefficient Coherency checking off.
2'b01	OCOR_KEY_LOW	Key Byte is low byte (OCOR).
2'b10	OCOR_KEY_MID	Key Byte is med byte (OCORM).
2'b11	OCOR_KEY_HIGH	Key Byte is high byte (OCORH).

1.3.210   DEC_COHER (continued)

Table 1-129. Bit field encoding: samp_key_enum

Value	Name	Description
2'b00	SAMP_KEY_OFF	Output Sample Coherency checking off.
2'b01	SAMP_KEY_LOW	Key Byte is low byte (OUTSAMP).
2'b10	SAMP_KEY_MID	Key Byte is med byte (OUTSAMPM).
2'b11	SAMP_KEY_HIGH	Key Byte is high byte (OUTSAMPH).

1.3.211   TMR[0..3]_CFG0

Configuration Register CFG0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CFG0: 0x40004F00   TMR1_CFG0: 0x40004F0C

TMR2_CFG0: 0x40004F18   TMR3_CFG0: 0x40004F24

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R		R	R	R	R	R	R
Retention	RET		RET	RET	RET	RET	RET	RET
Name	DEADBAND_PERIOD		DB	INV	CMP_BUFF	ONESHOT	MODE	EN

This register is used to configure the timer block.

Bits	Name	Description
7:6	DEADBAND_PERIOD[1:0]	Deadband Period
5	DB	Deadband mode--Deadband phases phi1 and phi2 are outputted on CMP and TC output pins respectively. See Table 1-130.
4	INV	Invert sense of TIMEREN signal
3	CMP_BUFF	Buffer compare register. Compare register updates only on timer terminal count.
2	ONESHOT	Timer stops upon reaching stop condition defined by TMR_CFG bits. Can be restarted by asserting TIMER RESET or disabling and re-enabling block.
1	MODE	Mode. (0 = Timer; 1 = Comparator) See Table 1-131.
0	EN	Enables timer/comparator.

Table 1-130. Bit field encoding: db_enum

Value	Name	Description
1'b0	Timer	CMP and TC are output.
1'b1	Deadband	PHI1 (instead of CMP) and PHI2 (instead of TC) are output.

Table 1-131. Bit field encoding: mode_enum

Value	Name	Description
1'b0	Timer	Timer mode. CNT/CMP register holds timer count value.
1'b1	Comparator	Comparator mode. CNT/CMP register holds comparator threshold value.

1.3.212 TMR[0..3]_CFG1

Configuration Register CFG1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CFG1: 0x40004F01   TMR1_CFG1: 0x40004F0D

TMR2_CFG1: 0x40004F19   TMR3_CFG1: 0x40004F25

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R			R	R	R	R
Retention	RET	RET			RET	RET	RET	RET
Name	BUS_CLK_SEL	CLK_BUS_EN_SEL			DBMODE	DCOR	FTC	IRQ_SEL

This register is used to configure the timer block.

Bits	Name	Description
7	BUS_CLK_SEL	Bus Clock selection.
		See Table 1-132.
6:4	CLK_BUS_EN_SEL[2:0]	Digital Global Clock selection.
		See Table 1-133.
3	DBMODE	Deadband mode (asynchronous/synchronous). CMP output pin is also affected when not in deadband mode (CFG0.DEADBAND).
		See Table 1-134.
2	DCOR	Disable Clear on Read (DCOR) of Status Register SR0.
		See Table 1-135.
1	FTC	First Terminal Count (FTC). Setting this bit forces a single pulse on the TC pin when first enabled.
		See Table 1-136.
0	IRQ_SEL	Irq selection. (0 = raw interrupts; 1 = status register interrupts)
		See Table 1-137.

Table 1-132. Bit field encoding: bus_sel_enum

Value	Name	Description
1'b0	clk_d	Use the digital clocks, clk_d[*], as system clock.
1'b1	clk_bus	Use the system bus clock, clk_bus, as system clock.

Table 1-133. Bit field encoding: clk_cfg_enum

Value	Name	Description
3'b000	clk_d0	Select digital clock 0, clk_d[0], as clock enable.
3'b001	clk_d1	Select digital clock 1, clk_d[1], as clock enable.
3'b010	clk_d2	Select digital clock 2, clk_d[2], as clock enable.
3'b011	clk_d3	Select digital clock 3, clk_d[3], as clock enable.
3'b100	clk_d4	Select digital clock 4, clk_d[4], as clock enable.
3'b101	clk_d5	Select digital clock 5, clk_d[5], as clock enable.

1.3.212   TMR[0..3]_CFG1 (continued)

Table 1-133. Bit field encoding: clk_cfg_enum

3'b110	clk_d6	Select digital clock 6, clk_d[6], as clock enable.
3'b111	clk_d7	Select digital clock 7, clk_d[7], as clock enable.

Table 1-134. Bit field encoding: dbmode_enum

Value	Name	Description
1'b0	Asynchronous	Asynchronous kill: Output is gated off immediately, and restored after a minimum of 1 application clock cycle.
1'b1	Synchronous	Synchronous kill: Output is gated of immediately, and restored after a minimum of one full counter period (at the terminal count).

Table 1-135. Bit field encoding: dcor_enum

Value	Name	Description
1'b0	Enable clear on read	Clear status register, SR0, when read.
1'b1	Disable clear on read	Do not clear status register, SR0, when read.

Table 1-136. Bit field encoding: ftc_enum

Value	Name	Description
1'b0	Disable FTC	Disable the single cycle pulse, which signifies the timer is starting.
1'b1	Enable FTC	Enable the single cycle pulse, which signifies the timer is starting.

Table 1-137. Bit field encoding: irq_sel_enum

Value	Name	Description
1'b0	Raw IRQ	IRQ from raw signals, maskable by corresponding mask bit in SR0 register.
1'b1	Status IRQ	IRQ from status signals, maskable by corresponding mask bit in SR0 register. Clear interrupt by writing '0' to corresponding status bit of SR0 register.

1.3.213   TMR[0..3]_CFG2

Configuration Register CFG2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CFG2: 0x40004F02   TMR1_CFG2: 0x40004F0E

TMR2_CFG2: 0x40004F1A   TMR3_CFG2: 0x40004F26

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:000			R/W:0	R/W:0	NA:00	
HW Access	R	R			R	R	NA	
Retention	RET	RET			RET	RET	NA	
Name	HW_EN	CMP_CFG			ROD	COD	RSVD	

This register is used to configure the timer block.

Bits	Name	Description
7	HW_EN	When set Timer Enable controls counting.
6:4	CMP_CFG[2:0]	Comparator configuration: 000 = '=='; 001 = '<'; 010 = '<=' 011 = '>'; 100 = '>='
		See Table 1-138.
3	ROD	Reset On Disable (ROD). Resets internal state of output logic.
2	COD	Clear On Disable (COD). Clears or gates outputs to zero.

Table 1-138. Bit field encoding: cmp_cfg_enum

Value	Name	Description
3'b000	Equal	Compare Equal '=='
3'b001	Less than	Compare Less Than '<'.
3'b010	Less than or equal	Compare Less Than or Equal '<='.
3'b011	Greater	Compare Greater Than '>'.
3'b100	Greater than or equal	Compare Greater Than or Equal '>='.

Table 1-139. Bit field encoding: tmr_cfg_enum

Value	Name	Description
2'b00	Continuous	Timer runs while EN bit of CFG0 register is set to '1'.
2'b01	Pulsewidth	Timer runs from positive to negative edge of TIMEREN.
2'b10	Period	Timer runs from positive to positive edge of TIMEREN.
2'b11	Irq	Timer runs until IRQ.

1.3.214   TMR[0..3]_SR0

Status Register SR0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_SR0: 0x40004F03   TMR1_SR0: 0x40004F0F

TMR2_SR0: 0x40004F1B   TMR3_SR0: 0x40004F27

Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	TC	CAP_CMP	TEN	TSTOP	MTC	MCAP_CMP	MTEN	MTSTOP

This register us used to configure interrupt masking and obtain status. Status bits 7-4 are cleared on read.

Bits	Name	Description
7	TC	Terminal count status. Interrupt,Sticky (individual bits)
6	CAP_CMP	Capture/Compare status (MODE = 0--Capture; MODE = 1--Compare). Interrupt,Sticky (individual bits)
5	TEN	Timer enable status. Interrupt,Sticky (individual bits)
4	TSTOP	Timer stop status. Interrupt,Sticky (individual bits)
3	MTC	Terminal count interrupt mask. (0 = Masked; 1 = Unmasked)
2	MCAP_CMP	Capture/Compare interrupt mask (MODE = 0--Capture; MODE = 1--Compare). (0 = Masked; 1 = Unmasked)
1	MTEN	Timer enable interrupt mask. (0 = Masked; 1 = Unmasked)
0	MTSTOP	Timer stop interrupt mask. (0 = Masked; 1 = Unmasked)

1.3.215   TMR[0..3]_PER0

Timer Period Register PER0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_PER0: 0x40004F04   TMR1_PER0: 0x40004F10

TMR2_PER0: 0x40004F1C   TMR3_PER0: 0x40004F28

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TIMER_PERIOD0							

This register contains the count value the timer is loaded with. When enabled the counter down counts from the value of this register to zero. NOTE: A period of 0 is not supported.

Bits	Name	Description
7:0	TIMER_PERIOD0[7:0]	Determines the high byte of the period for the timer.

1.3.216   TMR[0..3]_PER1

Timer Period Register PER1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_PER1: 0x40004F05   TMR1_PER1: 0x40004F11

TMR2_PER1: 0x40004F1D   TMR3_PER1: 0x40004F29

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	TIMER_PERIOD1							

This register contains the count value the timer is loaded with. When enabled the counter down counts from the value of this register to zero. NOTE: A period of 0 is not supported.

Bits	Name	Description
7:0	TIMER_PERIOD1[7:0]	Determines the low byte of the period for the timer.

1.3.217   TMR[0..3]_CNT_CMP0

Count/Comparator value CNT/CMP0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CNT_CMP0: 0x40004F06   TMR1_CNT_CMP0: 0x40004F12

TMR2_CNT_CMP0: 0x40004F1E   TMR3_CNT_CMP0: 0x40004F2A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COUNT_COMPARE0							

This register is a shared register. Its meaning depends upon the value of the MODE bit in the CFG0 register. (MODE = 0-- Count value; MODE = 1--Comparator value).

Bits	Name	Description
7:0	COUNT_COMPARE0[7:0]	MODE = 0--LSB of current count value; MODE = 1--LSB of comparator threshold.

1.3.218 TMR[0..3]_CNT_CMP1

Count/Comparator value CNT/CMP1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CNT_CMP1: 0x40004F07   TMR1_CNT_CMP1: 0x40004F13

TMR2_CNT_CMP1: 0x40004F1F   TMR3_CNT_CMP1: 0x40004F2B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	COUNT_COMPARE1							

This register is a shared register. Its meaning depends upon the value of the MODE bit in the CFG0 register. (MODE = 0--Count value; MODE = 1--Comparator value).

Bits	Name	Description
7:0	COUNT_COMPARE1[7:0]	MODE = 0--MSB of current count value; MODE = 1--MSB of comparator threshold.

1.3.219 TMR[0..3]_CAP0

Capture Value CAP0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CAP0: 0x40004F08   TMR1_CAP0: 0x40004F14

TMR2_CAP0: 0x40004F20   TMR3_CAP0: 0x40004F2C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CAPTURE_VALUE0							

This register holds the captured LSB of the timer count value. A 16-bit read of the CNT register returns the current timer value and captures. An 8-bit LSB read of the CNT register returns the LSB and captures both the LSB and MSB. This register only has meaning when MODE = 0 and is not to be used for any purpose when MODE = 1.

Bits	Name	Description
7:0	CAPTURE_VALUE0[7:0]	Captured LSB of the timer count value.

1.3.220   TMR[0..3]_CAP1

Capture Value CAP1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_CAP1: 0x40004F09   TMR1_CAP1: 0x40004F15

TMR2_CAP1: 0x40004F21   TMR3_CAP1: 0x40004F2D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CAPTURE_VALUE1							

This register holds the captured MSB of the timer count value. A 16-bit read of the CNT register returns the current timer value and captures. An 8-bit LSB read of the CNT register returns the LSB and captures both the LSB and MSB. This register only has meaning when MODE = 0 and is not to be used for any purpose when MODE = 1.

Bits	Name	Description
7:0	CAPTURE_VALUE1[7:0]	Captured MSB of the timer count value.

1.3.221   TMR[0..3]_RT0

Configuration Register RT0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TMR0_RT0: 0x40004F0A   TMR1_RT0: 0x40004F16

TMR2_RT0: 0x40004F22   TMR3_RT0: 0x40004F2E

Name	DataReg_DM_alias	DataReg_DP_alias	DataReg_alias					

This register is used to set the output data output state for the corresponding GPIO port.

Bits	Name	Description
7	DataReg_DM_alias	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.
6	DataReg_DP_alias	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.
5:0	DataReg_alias[5:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port. This register is only accessible if the PRTxBIT_MASK register bits are set.

1.3.228 PRT[0..14]_PS_ALIAS

Aliased Port Pin State Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_PS_ALIAS: 0x40005090   PRT1_PS_ALIAS: 0x40005091

PRT2_PS_ALIAS: 0x40005092   PRT3_PS_ALIAS: 0x40005093

PRT4_PS_ALIAS: 0x40005094   PRT5_PS_ALIAS: 0x40005095

PRT6_PS_ALIAS: 0x40005096   PRT12_PS_ALIAS: 0x4000509C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R							
Retention	RET							
Name	PinState_alias							

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7:0	PinState_alias[7:0]	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.

1.3.229 PRT15_PS15_ALIAS

Aliased Port Pin State Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_PS15_ALIAS: 0x4000509F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:0	R:000000					
HW Access	R/W	R/W	R/W					
Retention	RET	RET	RET					
Name	PinState_DM_alias	PinState_DP_alias	PinState_alias					

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7	PinState_DM_alias	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.
6	PinState_DP_alias	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.
5:0	PinState_alias[5:0]	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 0 Reads LOW if the pin voltage is below that threshold, logic low.

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DriveMode							

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO chapter section on IO drive modes for detailed information on the eight different drive mode configurations.

Bits	Name	Description
7:0	DriveMode[7:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high.

$$DM [2:0] = \{PRT \, X .DM2 [y] , PRT \, X .DM1 [y] , PRT \, X .DM0 [y] \}$$

DM [2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only   3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, stong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

1.3.233   PRT[0..11]_SLW

Port slew rate control

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_SLW: 0x40005105   PRT1_SLW: 0x40005115

PRT2_SLW: 0x40005125   PRT3_SLW: 0x40005135

PRT4_SLW: 0x40005145   PRT5_SLW: 0x40005155

PRT6_SLW: 0x40005165

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	SlwCtl							

The output drive on any I/O pin can be set to a fast edge rate mode (Slew=0) or slow edge rate mode (Slew=1) The slew rate only applies to strong output drive modes, not to resistive drive modes. Slower edge rates normally reduce EMI issues and are recommended when speed is not critical.

Bits	Name	Description
7:0	SlwCtl[7:0]	Each bit controls the output edge rate of the corresponding port pin. 1'b0 Fast edge rate mode 1'b1 Slow edge rate mode

1.3.234   PRT[0..11]_BYP

Port Bypass enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_BYP: 0x40005106   PRT1_BYP: 0x40005116

SW Access:Reset	NA:0000				R/W:000			R/W:0
HW Access	NA				R			R
Retention	NA				RET			RET
Name	RSVD				portEmifCfg			vtrip_sel

The port wide vtrip select register is used to select the input buffer trip point select. The emif configuration bits are used to configure the port for external memory access.

Bits	Name	Description
3:1	portEmifCfg[2:0]	GPIO emif selection option configures the port for External memory interface.
		See Table 1-146.
0	vtrip_sel	The GPIO cells include a vtrip_sel signal to alter the input buffer voltage.
		See Table 1-147.

Table 1-146. Bit field encoding: emif_cfg_enum

Value	Name	Description
3'b000	NOT_EMIF	Port not selected for EMIF control
3'b001	LSB_ADDR	Port selected as Address LS byte range
3'b010	UPR_ADDR	Port selected as Address upper byte range
3'b011	MSB_ADDR	Port selected as Address MS byte range
3'b101	LSB_DATA	Port selected as Data lower byte range
3'b110	MSB_DATA	Port selected as Data upper byte range

Table 1-147. Bit field encoding: vtrip_sel_enum

Value	Name	Description
1'b0	VTRIP_CMOS	Input buffer functions as a CMOS input buffer.
1'b1	VTRIP_LVTTL	Input buffer functions as a LVTTL input buffer.

1.3.238   PRT[0..11]_PRT

Port wide configuration register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_PRT: 0x4000510A   PRT1_PRT: 0x4000511A

PRT2_PRT: 0x4000512A   PRT3_PRT: 0x4000513A

Table 1-149. Bit field encoding: bypass_en_enum

Value	Name	Description
1'b0	BYPASS_DIS	bypass function disabled.
1'b1	BYPASS_EN	bypass function enabled.

1.3.239   PRT[0..11]_BIT_MASK

Bit-mask for Aliased Register access

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_BIT_MASK: 0x4000510B   PRT1_BIT_MASK: 0x4000511B

PRT2_BIT_MASK: 0x4000512B   PRT3_BIT_MASK: 0x4000513B

PRT4_BIT_MASK: 0x4000514B   PRT5_BIT_MASK: 0x4000515B

PRT6_BIT_MASK: 0x4000516B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	bit_mask							

The bits asserted in the bit-mask register allow direct access to the data register or pin state register via the aliased registers.

Bits	Name	Description
7:0	bit_mask[7:0]	1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.

1.3.240   PRT[0..11]_AMUX

Port Analog global mux bus enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_AMUX: 0x4000510C   PRT1_AMUX: 0x4000511C

PRT2_AMUX: 0x4000512C   PRT3_AMUX: 0x4000513C

PRT4_AMUX: 0x4000514C   PRT5_AMUX: 0x4000515C

PRT6_AMUX: 0x4000516C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Amux							

Analog global mux switch.

Bits	Name	Description
7:0	Amux[7:0]	Connects analog mux bus to the pad when asserted.

1.3.241 PRT[0..11]_AG

Port Analog global enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_AG: 0x4000510D   PRT1_AG: 0x4000511D

PRT2_AG: 0x4000512D   PRT3_AG: 0x4000513D

PRT4_AG: 0x4000514D   PRT5_AG: 0x4000515D

PRT6_AG: 0x4000516D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	AnalogGlobal							

Analog global switch.

Bits	Name	Description
7:0	AnalogGlobal[7:0]	Connects analog global to the pad when asserted.

1.3.242   PRT[0..11]_LCD_COM_SEG

Port LCD Com seg bits.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_LCD_COM_SEG: 0x4000510E

PRT1_LCD_COM_SEG: 0x4000511E

PRT2_LCD_COM_SEG: 0x4000512E

PRT3_LCD_COM_SEG: 0x4000513E

PRT4_LCD_COM_SEG: 0x4000514E

PRT5_LCD_COM_SEG: 0x4000515E

PRT6_LCD_COM_SEG: 0x4000516E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	com_seg							

Selects whether a pin is set as a common or segment drive pin.

Bits	Name	Description
7:0	com_seg[7:0]	Specify whether the pin will drive common or segment mode when LCD is enabled. 1'b0 Segment 1'b1 Common

1.3.243   PRT[0..11]_LCD_EN

Port LCD enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_LCD_EN: 0x4000510F   PRT1_LCD_EN: 0x4000511F

PRT2_LCD_EN: 0x4000512F   PRT3_LCD_EN: 0x4000513F

PRT4_LCD_EN: 0x4000514F   PRT5_LCD_EN: 0x4000515F

PRT6_LCD_EN: 0x4000516F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Lcd_en							

Enables a given pin for LCD drive mode. Make sure PRT1_PIN2 LCD_EN is not set when P1_2 is used as configurable XRES, otherwise behavior of device is not guaranteed

Bits	Name	Description
7:0	Lcd_en[7:0]	Enable the pin for LCD mode. 1'b0 Disabled 1'b1 Enabled

1.3.244   PRT12_DR

Port Data Output Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_DR: 0x400051C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	DataReg							

This register is used to set the output data state for the corresponding GPIO port.

Bits	Name	Description
7:0	DataReg[7:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port.

1.3.245   PRT12_PS

Port Pin State Register1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_PS: 0x400051C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PinState							

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7:0	PinState[7:0]	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.

1.3.246   PRT12_DM[0..2]

Port Drive Mode Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_DM0: 0x400051C2   PRT12_DM1: 0x400051C3

PRT12_DM2: 0x400051C4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	\multicolumn{8}{R/W:00000000}							
HW Access	R							
Retention	RET							
Name	DriveMode							

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO chapter section on IO drive modes for detailed information on the eight different drive mode configurations.

Bits	Name	Description
7:0	DriveMode[7:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high.

$$DM [2{:}0] = \{PRT\,X.DM2\,[\,y\,],PRT\,X.DM1\,[\,y\,],PRT\,X.DM0\,[\,y\,]\}$$

DM [2:0] : Complete drive mode setting for pin [y]   3'b000 : Mode 0, input/output buffers disabled.   3'b001 : Mode 1, input only   3'b010 : Mode 2, weak pull-up, strong pull-down   3'b011 : Mode 3, strong pull-up, weak pull-down   3'b100 : Mode 4, open drain, strong pull-down   3'b101 : Mode 5, open drain, strong pull-up   3'b110 : Mode 6, stong pull-up, strong pull-down   3'b111 : Mode 7, weak pull-up, weak pull-down

1.3.247   PRT12_SLW

Port slew rate control

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_SLW: 0x400051C5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	SlwCtl							

The output drive on any I/O pin can be set to a fast edge rate mode (Slew=0) or slow edge rate mode (Slew=1) The slew rate only applies to strong output drive modes, not to resistive drive modes. Slower edge rates normally reduce EMI issues and are recommended when speed is not critical.

Bits	Name	Description
7:0	SlwCtl[7:0]	Each bit controls the output edge rate of the corresponding port pin. 1'b0 Fast edge rate mode 1'b1 Slow edge rate mode

1.3.248   PRT12_BYP

Port Bypass enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_BYP: 0x400051C6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Bypass							

The Port Bypass Registers select output data from either the data output register or internal sources such as digital global bus.

Bits	Name	Description
7:0	Bypass[7:0]	1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin. 1'b0 Port logic data register drives the corresponding port pin. *The drive mode settings must configure the port to enable the output buffer or the DSI dynamic drive control must configure the ouput enable for the pad.*

1.3.249   PRT12_BIE

Port Bidirection enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_BIE: 0x400051C7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	BidirectEn							

The Port Bidirectional Enable Registers are used to enable dynamic bidirectional mode at any pin.

Bits	Name	Description
7:0	BidirectEn[7:0]	Each bit controls the bidirectional mode of the corresponding port pin. 1'b0 Normal operation of pad. Drive mode setting configures output buffer 1'b1 Selected dynamic control DSI configures output buffer

1.3.250   PRT12_INP_DIS

Input buffer disable override

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_INP_DIS: 0x400051C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	Inp_dis							

The bits asserted force the input buffers off.

Bits	Name	Description
7:0	Inp_dis[7:0]	1'b1 Input buffers are disabled, overrides drive mode register settings. 1'b0 Input buffers are configured based on drive mode register settings.

1.3.251   PRT12_SIO_HYST_EN

SIO Hysteresis enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_SIO_HYST_EN: 0x400051C9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sio_diff_hyst_en							

The SIO hysteresis enable for the SIO differential input buffer.

Bits	Name	Description
7:0	sio_diff_hyst_en[7:0]	(no description)

1.3.252   PRT12_PRT

Port wide configuration register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_PRT: 0x400051CA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:0	W:0	W:0	NA:0	W:0	W:0	W:0	NA:0
HW Access	R	R	R	NA	R	R	R	NA
Retention	RET	RET	RET	NA	RET	RET	RET	NA
Name	byPass	slew	bidirectEn	RSVD	driveMode2	driveMode1	driveMode0	RSVD

The Port Configuration Register accesses several available configuration registers on a port-wide basis with a single bit write.

Bits	Name	Description
7	byPass	The Bypass bit sets all the bits for the port bypass register.
		See Table 1-151.
6	slew	The slew bit is the same as the corresponding bit in the port slew register.
5	bidirectEn	The BiDir En bit sets all bits for the port bidirection enable register.
		See Table 1-150.
3	driveMode2	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
2	driveMode1	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
1	driveMode0	A write to this bit sets all bits for the corresponding drive mode register of the entire port.

Table 1-150. Bit field encoding: bidir_en_enum

Value	Name	Description
1'b0	BIDIR_DIS	dynamic bidirectional mode disabled.
1'b1	BIDIR_EN	dynamic bidirectional mode enabled.

Table 1-151. Bit field encoding: bypass_en_enum

Value	Name	Description
1'b0	BYPASS_DIS	bypass function disabled.
1'b1	BYPASS_EN	bypass function enabled.

1.3.253   PRT12_BIT_MASK

Bit-mask for Aliased Register access

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_BIT_MASK: 0x400051CB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	bit_mask							

The bits asserted in the bit-mask register allow direct access to the data register or pin state register via the aliased registers.

Bits	Name	Description
7:0	bit_mask[7:0]	1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.

1.3.254   PRT12_SIO_REG_HIFREQ

Regulated pull-up driver DC current setting

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_SIO_REG_HIFREQ: 0x400051CC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	sio_reg_hifr eq_7_6	RSVD	sio_reg_hifr eq_5_4	RSVD	sio_reg_hifr eq_3_2	RSVD	sio_reg_hifr eq_1_0	RSVD

Sets each SIO pair's pull-up driver DC current. For output frequency <=10MHz, setting this low will lower the DC current on the SIO pin pair. For output frequency >10MHz <= 33MHz, set the bit high.

Bits	Name	Description
7	sio_reg_hifreq_7_6	pull-up driver DC current
5	sio_reg_hifreq_5_4	pull-up driver DC current
3	sio_reg_hifreq_3_2	pull-up driver DC current
1	sio_reg_hifreq_1_0	pull-up driver DC current

1.3.255   PRT12_AG

Port Analog global enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_AG: 0x400051CD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:00		R/W:00		R/W:00	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	AnalogGlobal_7_6		AnalogGlobal_5_4		AnalogGlobal_3_2		AnalogGlobal_1_0	

Analog global switch.

Bits	Name	Description
7:6	AnalogGlobal_7_6[1:0]	Connects analog global when asserted. See Table 1-152.
5:4	AnalogGlobal_5_4[1:0]	Connects analog global when asserted. See Table 1-152.
3:2	AnalogGlobal_3_2[1:0]	Connects analog global when asserted. See Table 1-152.
1:0	AnalogGlobal_1_0[1:0]	Connects analog global when asserted. See Table 1-152.

Table 1-152. Bit field encoding: pr12_ag_enum

Value	Name	Description
2'b00	NO_AG	No AG selected.
2'b01	AG0_SEL	low bit AG connection selected.
2'b10	AG1_SEL	high bit AG connection selected.
2'b11	VCCD_SEL	VCCD connection selected.

1.3.256 PRT12_SIO_CFG

SIO Input Output Configuration

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_SIO_CFG: 0x400051CE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	ibuf_sel_7_6	vreg_en_7_6	ibuf_sel_5_4	vreg_en_5_4	ibuf_sel_3_2	vreg_en_3_2	ibuf_sel_1_0	vreg_en_1_0

Sets each SIO pair's input output Configuration. vreg_en=0 & ibuf_sel=0 sets the mode to Single Ended Input Buffer, Non-regulated Output Buffer. vreg_en=0 & ibuf_sel=1 sets the mode to Differential Input Buffer, Non-regulated Output Buffer. vreg_en=1 & ibuf_sel=0 sets the mode to Single Ended Input Buffer, Regulated Output Buffer. vreg_en=1 & ibuf_sel=1 sets the mode to Differential Input Buffer, Regulated Output Buffer.

Bits	Name	Description
7	ibuf_sel_7_6	sets the ibuf_sel for the corresponding SIO pair
6	vreg_en_7_6	sets the vreg_en for the corresponding SIO pair
5	ibuf_sel_5_4	sets the ibuf_sel for the corresponding SIO pair
4	vreg_en_5_4	sets the vreg_en for the corresponding SIO pair
3	ibuf_sel_3_2	sets the ibuf_sel for the corresponding SIO pair
2	vreg_en_3_2	sets the vreg_en for the corresponding SIO pair
1	ibuf_sel_1_0	sets the ibuf_sel for the corresponding SIO pair
0	vreg_en_1_0	sets the vreg_en for the corresponding SIO pair

1.3.257   PRT12_SIO_DIFF

Differential Input Buffer reference voltage selection

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_SIO_DIFF: 0x400051CF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vref_sel_7_6	vtrip_sel_7_6	vref_sel_5_4	vtrip_sel_5_4	vref_sel_3_2	vtrip_sel_3_2	vref_sel_1_0	vtrip_sel_1_0

Sets each SIO pair's input buffer switching threshold. If ibuf_sel=0, vref_sel has no impact as the single-ended receiver is used. In this case: vtrip_sel=0 sets the single-ended input buffer threshold to CMOS levels. vtrip_sel=1 sets the single-ended input buffer threshold to LVTTL levels. If ibuf_sel=1, the differential receiver is used and vref_sel does have functional impact. In this case: vref_sel=0 & vtrip_sel=0 sets the differential input buffer threshold to 0.5*vio. vref_sel=0 & vtrip_sel=1 sets the differential input buffer threshold to 0.4*vio. vref_sel=1 & vtrip_sel=0 sets the differential input buffer threshold to 0.5*vohref. vref_sel=1 & vtrip_sel=1 sets the differential input buffer threshold to vohref.

Bits	Name	Description
7	vref_sel_7_6	sets the vref_sel for the corresponding SIO pair
6	vtrip_sel_7_6	sets the vtrip_sel for the corresponding SIO pair
5	vref_sel_5_4	sets the vref_sel for the corresponding SIO pair
4	vtrip_sel_5_4	sets the vtrip_sel for the corresponding SIO pair
3	vref_sel_3_2	sets the vref_sel for the corresponding SIO pair
2	vtrip_sel_3_2	sets the vtrip_sel for the corresponding SIO pair
1	vref_sel_1_0	sets the vref_sel for the corresponding SIO pair
0	vtrip_sel_1_0	sets the vtrip_sel for the corresponding SIO pair

1.3.258   PRT15_DR

Port Data Output Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_DR: 0x400051F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	DataReg_DM	DataReg_DP	DataReg					

This register is used to set the output data state for the corresponding GPIO port.

Bits	Name	Description
7	DataReg_DM	The data written to this register specifies the high (Data=1) or low (Data=0) state for the corresponding USB pin when GPIO mode is enabled by setting the USB.USBIO_CR1 iomode bit.
6	DataReg_DP	The data written to this register specifies the high (Data=1) or low (Data=0) state for the corresponding USB pin when GPIO mode is enabled by setting the USB.USBIO_CR1 iomode bit.
5:0	DataReg[5:0]	The data written to this register specifies the high (Data=1) or low (Data=0) state for the GPIO pin at each bit location of the selected port.

1.3.259   PRT15_PS

Port Pin State Register1

Reset: Reset Signals Listed Below

Register : Address

PRT15_PS: 0x400051F1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:U	R:U	R:000000					
HW Access	R/W	R/W	R/W					
Retention	NONRET	NONRET	RET					
Name	PinState_DM	PinState_DP	PinState					

The Port Pin State Registers PRTxPS read the logical pin state for the corresponding GPIO port. Writes to this register have no effect. If the drive mode for the pin is set to High-Z Analog, the state will read 0 independent of the voltage on the pin.

Bits	Name	Description
7	PinState_DM	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.
6	PinState_DP	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.
5:0	PinState[5:0]	Reads of this register return the logical state of the corresponding I/O pin. The data read from this register specifies the logical state of the pin: 1'b1 Reads HIGH if the pin voltage is above the input buffer threshold, logic high. 1'b0 Reads LOW if the pin voltage is below that threshold, logic low.

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	PinState_DP, PinState_DM
System reset for retention flops [reset_all_retention]	PinState[5:0]

1.3.260 PRT15_DM0

Port Drive Mode Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_DM0: 0x400051F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	DriveMode_DM	DriveMode_DP	DriveMode					

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO chapter section on IO drive modes for detailed information on the eight different drive mode configurations. The PRTx.DM0[7:6] select the drive mode setting for the limited GPIO functionality of the USBIO.

Bits	Name	Description
7	DriveMode_DM	If iomode is set to GPIO mode in USB_USBIO_CR1, driveMode_DM configures the D- pin drive mode. If IOMode is set to USB mode, driveMode_DM is ignored by the D-. 1'b0: open drain mode. If dmi is high, DM is open drain, if dmi is low, DM forced low. 1'b1: drive out. The pin follows the Datareg_DM value
6	DriveMode_DP	Pull-up enable control for USBIO D+ pin. If iomode is set to GPIO mode in USB_USBIO_CR1, driveMode_DP configures the D+ pin drive mode. If IOMode is set to USB mode, driveMode_DP is ignored by the D+. 1'b0: open drain mode. If dpi is high, DP is open drain, if dpi is low, DP forced low. 1'b1: drive out. The pin follows the Datareg_DP value
5:0	DriveMode[5:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high. DM [2:0] = {PRT X .DM2 [y] ,PRT X .DM1 [y] ,PRT X .DM0 [y] } DM [2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, stong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

1.3.261   PRT15_DM1

Port Drive Mode Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_DM1: 0x400051F3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	PullUp_en_DM	PullUp_en_DP	DriveMode					

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO chapter section on IO drive modes for detailed information on the eight different drive mode configurations. The PRTx.DM1[7:6] enable the 5 kOhm pull-ups on the limited GPIO functionality USBIO pins.

Bits	Name	Description
7	PullUp_en_DM	Pull-up enable control for USBIO D- pin. If iomode is set to GPIO mode in USB_USBIO_CR1, pullUp_en_DM configures the D- 5kOhm pull-up resistor. If IOMode is set to USB mode, pullUp_en_DM is ignored by the D-. 1'b1: 5kOhm pull-up enabled on D- 1'b0: no pull-up
6	PullUp_en_DP	If iomode is set to GPIO mode in USB_USBIO_CR1, pullUp_en_DP configures the D+ 5kOhm pull-up resistor. If IOMode is set to USB mode, pullUp_en_DP is ignored by the D+. 1'b1: 5kOhm pull-up enabled on D+ 1'b0: no pull-up
5:0	DriveMode[5:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high. DM [2:0] = {PRT X .DM2 [y] ,PRT X .DM1 [y] ,PRT X .DM0 [y] } DM [2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, stong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

1.3.262 PRT15_DM2

Port Drive Mode Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_DM2: 0x400051F4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		DriveMode					

These registers, PRTx.DM2, PRTx.DM1, and PRTx.DM0, combined value determines the unique drive mode of each bit in a GPIO port. Using a combination of the three drive mode registers available per port, there are eight possible drive modes for each port pin. The bit position of each port pin corresponds to the bit position of each of the three drive mode registers per port. The three bits from the drive mode registers grouped per pin and referred to as DM2, DM1, and DM0, or together as DM[2:0]. Please refer to the IO chapter section on IO drive modes for detailed information on the eight different drive mode configurations.

Bits	Name	Description
5:0	DriveMode[5:0]	1'b0 Corresponding drive mode register bit asserted low. 1'b1 Corresponding drive mode register asserted high. $DM[2:0] = \{PRT\,X.DM2[y], PRT\,X.DM1[y], PRT\,X.DM0[y]\}$ DM [2:0] : Complete drive mode setting for pin [y] 3'b000 : Mode 0, input/output buffers disabled. 3'b001 : Mode 1, input only 3'b010 : Mode 2, weak pull-up, strong pull-down 3'b011 : Mode 3, strong pull-up, weak pull-down 3'b100 : Mode 4, open drain, strong pull-down 3'b101 : Mode 5, open drain, strong pull-up 3'b110 : Mode 6, stong pull-up, strong pull-down 3'b111 : Mode 7, weak pull-up, weak pull-down

1.3.263   PRT15_SLW

Port slew rate control

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_SLW: 0x400051F5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		SlwCtl					

The output drive on any I/O pin can be set to a fast edge rate mode (Slew=0) or slow edge rate mode (Slew=1) The slew rate only applies to strong output drive modes, not to resistive drive modes. Slower edge rates normally reduce EMI issues and are recommended when speed is not critical.

Bits	Name	Description
5:0	SlwCtl[5:0]	Each bit controls the output edge rate of the corresponding port pin. 1'b0 Fast edge rate mode 1'b1 Slow edge rate mode

1.3.264   PRT15_BYP

Port Bypass enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_BYP: 0x400051F6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:000000					
HW Access	R		R					
Retention	RET		RET					
Name	Bypass_usb		Bypass					

The Port Bypass Registers select output data from either the data output register or internal sources such as digital global bus. Shared USB pins must be set to GPIO mode.

Bits	Name	Description
7:6	Bypass_usb[1:0]	1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin. 1'b0 DMI/DPI outputs from USB drives the corresponding port pin configured in IO mode. *GPIO mode must be enabled in order to bypass the shared function USB/IO pins.*
5:0	Bypass[5:0]	1'b1 Selected digital system interconnect (DSI) drives the corresponding port pin. 1'b0 Port logic data register drives the corresponding port pin. *The drive mode settings must configure the port to enable the output buffer or the DSI dynamic drive control must configure the ouput enable for the pad.*

1.3.265 PRT15_BIE

Port Bidirection enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_BIE: 0x400051F7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		BidirectEn					

The Port Bidirectional Enable Registers are used to enable dynamic bidirectional mode at any pin.

Bits	Name	Description
5:0	BidirectEn[5:0]	Each bit controls the bidirectional mode of the corresponding port pin. 1'b0 Normal operation of pad. Drive mode setting configures output buffer 1'b1 Selected dynamic control DSI configures output buffer

1.3.266   PRT15_INP_DIS

Input buffer disable override

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_INP_DIS: 0x400051F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:1	R/W:1	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	seinput_dis _dm	seinput_dis _dp	Inp_dis					

The bits asserted force the input buffers off.

Bits	Name	Description
7	seinput_dis_dm	1'b1 Single ended input disabled, IO mode disabled for USBIO. 1'b0 Single ended input enabled.
6	seinput_dis_dp	1'b1 Single ended input disabled, IO mode disabled for USBIO. 1'b0 Single ended input enabled.
5:0	Inp_dis[5:0]	1'b1 Input buffers are disabled, overrides drive mode register settings. 1'b0 Input buffers are configured based on drive mode register settings.

1.3.267   PRT15_CTL

Port wide control signals

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_CTL: 0x400051F9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							vtrip_sel

The port wide vtrip select register is used to select the input buffer trip point select

Bits	Name	Description
0	vtrip_sel	The GPIO cells include a vtrip_sel signal to alter the input buffer voltage. See Table 1-153.

Table 1-153. Bit field encoding: vtrip_sel_enum

Value	Name	Description
1'b0	VTRIP_CMOS	Input buffer functions as a CMOS input buffer.
1'b1	VTRIP_LVTTL	Input buffer functions as a LVTTL input buffer.

1.3.268   PRT15_PRT

Port wide configuration register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_PRT: 0x400051FA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:0	W:0	W:0	NA:0	W:0	W:0	W:0	NA:0
HW Access	R	R	R	NA	R	R	R	NA
Retention	RET	RET	RET	NA	RET	RET	RET	NA
Name	byPass	slew	bidirectEn	RSVD	driveMode2	driveMode1	driveMode0	RSVD

The Port Configuration Register accesses several available configuration registers on a port-wide basis with a single bit write. The write will have no effect on reserved register bits. Please reference the aplicable registers definitions.

Bits	Name	Description
7	byPass	The Bypass bit sets all the bits for the port bypass register. See Table 1-155.
6	slew	The slew bit is the same as the corresponding bit in the port slew register.
5	bidirectEn	The BiDir En bit sets all bits for the port bidirection enable register. See Table 1-154.
3	driveMode2	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
2	driveMode1	A write to this bit sets all bits for the corresponding drive mode register of the entire port.
1	driveMode0	A write to this bit sets all bits for the corresponding drive mode register of the entire port.

Table 1-154. Bit field encoding: bidir_en_enum

Value	Name	Description
1'b0	BIDIR_DIS	dynamic bidirectional mode disabled.
1'b1	BIDIR_EN	dynamic bidirectional mode enabled.

Table 1-155. Bit field encoding: bypass_en_enum

Value	Name	Description
1'b0	BYPASS_DIS	bypass function disabled.
1'b1	BYPASS_EN	bypass function enabled.

1.3.269 PRT15_BIT_MASK

Bit-mask for Aliased Register access

Reset:　　　　System reset for retention flops [reset_all_retention]

Register : Address

PRT15_BIT_MASK: 0x400051FB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:000000					
HW Access	R	R	R					
Retention	RET	RET	RET					
Name	bit_mask_dm	bit_mask_dp	bit_mask					

The bits asserted in the bit-mask register allow direct access to the data register or pin state register via the aliased registers.

Bits	Name	Description
7	bit_mask_dm	Aliased register access of port 15[7:6] is for USB pins when configured to GPIO mode. 1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.
6	bit_mask_dp	Aliased register access of port 15[7:6] is for USB pins when configured to GPIO mode. 1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.
5:0	bit_mask[5:0]	1'b1 Allow access to data register and pin state registers via aliased register address space. 1'b0 Block access to data register and pin state registers via aliased register address space.

1.3.270　PRT15_AMUX

Port Analog global mux bus enable

Reset:　　　　System reset for retention flops [reset_all_retention]

Register : Address

PRT15_AMUX: 0x400051FC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		Amux					

Analog global mux switch.

Bits	Name	Description
5:0	Amux[5:0]	Connects analog mux bus to the pad when asserted.

1.3.271   PRT15_AG

Port Analog global enable

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_AG: 0x400051FD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		AnalogGlobal					

Analog global switch.

Bits	Name	Description
5:0	AnalogGlobal[5:0]	Connects analog global to the pad when asserted.

1.3.272   PRT15_LCD_COM_SEG

Port LCD Com seg bits.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_LCD_COM_SEG: 0x400051FE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		com_seg					

Selects whether a pin is set as a common or segment drive pin.

Bits	Name	Description
5:0	com_seg[5:0]	Specify whether the pin will drive common or segment mode when LCD is enabled. 1'b0 Segment 1'b1 Common

1.3.273   PRT15_LCD_EN

Port LCD enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT15_LCD_EN: 0x400051FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:000000					
HW Access	NA		R					
Retention	NA		RET					
Name	RSVD		Lcd_en					

Enables a given pin for LCD drive mode

Bits	Name	Description
5:0	Lcd_en[5:0]	Enable the pin for LCD mode. 1'b0 Disabled 1'b1 Enabled

1.3.274   PRT0_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_OUT_SEL0: 0x40005200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.275 PRT0_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_OUT_SEL1: 0x40005201

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.276   PRT0_OE_SEL0

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_OE_SEL0: 0x40005202

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.277   PRT0_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_OE_SEL1: 0x40005203

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** }   TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.278   PRT0_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_DBL_SYNC_IN: 0x40005204

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.279 PRT0_SYNC_OUT

DSI sync out enable register.

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

PRT0_SYNC_OUT: 0x40005205

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.280 PRT0_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT0_CAPS_SEL: 0x40005206

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.281   PRT1_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_OUT_SEL0: 0x40005208

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** }   TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** }   TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.282   PRT1_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_OUT_SEL1: 0x40005209

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corre-sponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.283   PRT1_OE_SEL0

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_OE_SEL0: 0x4000520A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** }   TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.284   PRT1_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_OE_SEL1: 0x4000520B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.285   PRT1_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_DBL_SYNC_IN: 0x4000520C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.286   PRT1_SYNC_OUT

DSI sync out enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_SYNC_OUT: 0x4000520D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.287   PRT1_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT1_CAPS_SEL: 0x4000520E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.288   PRT2_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_OUT_SEL0: 0x40005210

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** }   TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** }   TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.289 PRT2_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_OUT_SEL1: 0x40005211

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.290 PRT2_OE_SEL0

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_OE_SEL0: 0x40005212

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** } TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.291   PRT2_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_OE_SEL1: 0x40005213

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [*x*] OE_SEL1 [*y*] , **PRT [*x*] OE_SEL0 [*y*]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.292 PRT2_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_DBL_SYNC_IN: 0x40005214

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.293   PRT2_SYNC_OUT

DSI sync out enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_SYNC_OUT: 0x40005215

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.294   PRT2_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT2_CAPS_SEL: 0x40005216

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.295 PRT3_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_OUT_SEL0: 0x40005218

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** }   TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** }   TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.296   PRT3_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_OUT_SEL1: 0x40005219

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.297   PRT3_OE_SEL0

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_OE_SEL0: 0x4000521A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [*x*] OE_SEL1 [*y*] , **PRT [*x*] OE_SEL0 [*y*]** }   TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.298   PRT3_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_OE_SEL1: 0x4000521B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.299   PRT3_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_DBL_SYNC_IN: 0x4000521C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.300   PRT3_SYNC_OUT

DSI sync out enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_SYNC_OUT: 0x4000521D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.301   PRT3_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT3_CAPS_SEL: 0x4000521E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.302   PRT4_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_OUT_SEL0: 0x40005220

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.303   PRT4_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_OUT_SEL1: 0x40005221

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.304 PRT4_OE_SEL0

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_OE_SEL0: 0x40005222

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** } TAP == 00 Select DSI dynamic oe 0 TAP == 01 Select DSI dynamic oe 1 TAP == 10 Select DSI dynamic oe 2 TAP == 11 Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.305   PRT4_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_OE_SEL1: 0x40005223

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [*x*] OE_SEL1 [*y*] , **PRT [*x*] OE_SEL0 [*y*]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.306   PRT4_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_DBL_SYNC_IN: 0x40005224

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.307   PRT4_SYNC_OUT

DSI sync out enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_SYNC_OUT: 0x40005225

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.308   PRT4_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT4_CAPS_SEL: 0x40005226

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	\multicolumn{8}{R/W:00000000}							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.309   PRT5_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_OUT_SEL0: 0x40005228

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** }   TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** }   TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.310   PRT5_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_OUT_SEL1: 0x40005229

SW Access:Reset	\multicolumn{8}{c}{R/W:00000000}							
HW Access	\multicolumn{8}{c}{R}							
Retention	\multicolumn{8}{c}{RET}							
Name	\multicolumn{8}{c}{portOutsel}							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port x pin y, the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port x pin y, the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [x] OUT_SEL1 [y]** , **PRT [x] OUT_SEL0 [y]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.311   PRT5_OE_SEL0

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_OE_SEL0: 0x4000522A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [*x*] OE_SEL1 [*y*] , **PRT [*x*] OE_SEL0 [*y*]** }   TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.312   PRT5_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_OE_SEL1: 0x4000522B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [x] OE_SEL1 [y] , **PRT [x] OE_SEL0 [y]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.313 PRT5_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_DBL_SYNC_IN: 0x4000522C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.314 PRT5_SYNC_OUT

DSI sync out enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_SYNC_OUT: 0x4000522D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.315   PRT5_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT5_CAPS_SEL: 0x4000522E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.316 PRT6_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT6_OUT_SEL0: 0x40005230

Bits	7	6	5	4	3	2	1	0
SW Access:Reset				R/W:00000000				
HW Access				R				
Retention				RET				
Name				portOutsel				

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00 Select DSI 0 TAP == 01 Select DSI 1 TAP == 10 Select DSI 2 TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00 Select DSI 4 TAP == 01 Select DSI 5 TAP == 10 Select DSI 6 TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.317   PRT6_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT6_OUT_SEL1: 0x40005231

Bits	7	6	5	4	3	2	1	0

Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [*x*] OE_SEL1 [*y*] , **PRT [*x*] OE_SEL0 [*y*]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.319 PRT6_OE_SEL1

Dynamic Drive Stength of Port Output Enable Select registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT6_OE_SEL1: 0x40005233

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOEsel							

The dynamic output enable select registers 1 and register 0 together select the DSI dynamic control bits for each port pin, the corresponding bit from each register is selects the DSI for each pad. This is implemented with a 4-to-1 multiplexr for each port pin output enable.

TAP == {PRT [*x*] OE_SEL1 [*y*] , **PRT [*x*] OE_SEL0 [*y*]** } TAP == 00   Select DSI dynamic oe 0   TAP == 01   Select DSI dynamic oe 1   TAP == 10   Select DSI dynamic oe 2   TAP == 11   Select DSI dynamic oe 3

Bits	Name	Description
7:0	portOEsel[7:0]	Selects which of the available taps are selected for the given I/O pin.

1.3.320   PRT6_DBL_SYNC_IN

DSI double sync enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT6_DBL_SYNC_IN: 0x40005234

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	dbl_sync_in							

The port double sync register selects to synchronize the data in from the port before driving the digital system interconnect (DSI) signals to the UDB.

Bits	Name	Description
7:0	dbl_sync_in[7:0]	When asserted selects to synchronize the data in from the corresponding pad.

1.3.321 PRT6_SYNC_OUT

DSI sync out enable register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT6_SYNC_OUT: 0x40005235

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	sync_out							

The port sync register selects to synchronize the data driving the pad using the existing port data register.

Bits	Name	Description
7:0	sync_out[7:0]	When asserted selects to synchronize the data from the DSI driving the corresponding pad.

1.3.322 PRT6_CAPS_SEL

Global DSI select register.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT6_CAPS_SEL: 0x40005236

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	caps_sel							

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
7:0	caps_sel[7:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.323   PRT12_OUT_SEL0

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_OUT_SEL0: 0x40005260

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	portOutsel							

The corresponding bits for each pad of Output select register 1 and register 0 together select the DSI net driving the corresponding output port pin for each bit of the port. This is implemented with a 4-to-1 multiplexer for each port pin output. This allows each pin to be driven by four of the eight available DSI connections to the port.

For port *x* pin *y* , the TAP selects from the dsi to pad 3 through 0 for pads 3 through 0 **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 0   TAP == 01   Select DSI 1   TAP == 10   Select DSI 2   TAP == 11 Select DSI 3

For port *x* pin *y* , the TAP selects from the dsi to pad 7 through 4 for pads 7 through 4. **TAP == {PRT [*x*] OUT_SEL1 [*y*]** , **PRT [*x*] OUT_SEL0 [*y*]** } TAP == 00   Select DSI 4   TAP == 01   Select DSI 5   TAP == 10   Select DSI 6   TAP == 11 Select DSI 7

Bits	Name	Description
7:0	portOutsel[7:0]	Selects which of the available taps are selected for the given I/O pin output.

1.3.324 PRT12_OUT_SEL1

Digital System Interconnect Port Pin Output Select Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PRT12_OUT_SEL1: 0x40005261

Bits	7	6	5	4	3	2	1	0

Name	RSVD		sync_out					

The global DSI select register. When enabled, the global DSI dynamic control is selected to drive the dig_glbl_ctl.

Bits	Name	Description
5:0	sync_out[5:0]	When asserted selects the global DSI to drive dig_glbl_ctl on the pad.

1.3.336   EMIF_NO_UDB

EMIF UDB/NO_UDB Mode Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_NO_UDB: 0x40005400

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							no_udb

This register indicates whether UDBs are generating external memory control signals or to enable EMIF to generate them for Flow Through Sync SRAM or Asynchronous SRAM. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
0	no_udb	1'b0: UDB Mode. In this mode EMIF bypasses the external memory transfer request to UDBs and UDBs should be configured to generate the control signals for external memory. 1`b1: NO_UDB Mode. In this mode, the EMIF generates the control signals for Flow through Sync SRAM or Async SRAM

1.3.337 EMIF_RP_WAIT_STATES

External Memory Interface Read Path Wait States Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_RP_WAIT_STATES: 0x40005401

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					rp_wait_states		

This register configures the additional wait states for read operation. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
2:0	rp_wait_states[2:0]	In NO_UDB mode the following table determines the minimum number of additional clock cycles (wait states) required to complete the external read operation (this table assumes EMIF_MEMCLK_DIV is programmed correctly relative to f(HCLK)): 0 <= f(HCLK) <= 19: RP_WAIT_STATES can be 0 or more 19 < f(HCLK) <= 33: RP_WAIT_STATES must be >= 1 33 < f(HCLK) <= 41: RP_WAIT_STATES can be 0 or more 41 < f(HCLK) <= 54: RP_WAIT_STATES must be >= 1 54 < f(HCLK) <= 67: RP_WAIT_STATES must be >= 2 67 < f(HCLK) <= 82: RP_WAIT_STATES must be >= 2 82 < f(HCLK) <= 95: RP_WAIT_STATES must be >= 3 95 < f(HCLK) <= 99: RP_WAIT_STATES must be >= 4

1.3.338   EMIF_MEM_DWN

External Memory Power Down Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_MEM_DWN: 0x40005402

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							mem_pd

This register puts the external memory into power down mode. This register is active only for Sync SRAM in NO_UDB mode. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
0	mem_pd	1`b1: External Memory power down.  1`b0: External memory power up

1.3.339 EMIF_MEMCLK_DIV

External Memory Clock Divider Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_MEMCLK_DIV: 0x40005403

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						memclk_div	

This register sets the divider value for external memory clock frequency. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
1:0	memclk_div[1:0]	2'b00: f(EM_clock) = f(HCLK), when f(HCLK) <= 33MHz. 2'b01: f(EM_clock) = 1/2f(HCLK), when 33MHz <= f(HCLK) <= 67MHz. 2'b10: f(EM_clock) = 1/3f(HCLK), when 67MHz <= f(HCLK) <= 99MHz. 2'b11: f(EM_clock) = 1/4f(HCLK), Backup configuration.

1.3.340   EMIF_CLOCK_EN

EMIF Clock Enable Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_CLOCK_EN: 0x40005404

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							clock_en

This register enables the clock for EMIF core logic.

Bits	Name	Description
0	clock_en	1'b0: Disable Clock for EMIF core logic. 1'b1: Enable Clock for EMIF core. Along with this bit, the input 'emif_clk_en' to EMIF block should also be 1'b1 to enable the clock. This input can be made 1'b1 by setting corresponding bit in PM.ACT.CFG5 register in Power Manager.

1.3.341 EMIF_EM_TYPE

External Memory Type Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_EM_TYPE: 0x40005405

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							em_type

This register indicates whether to generate control signals for Sync or Async SRAM in NO_UDB mode

Bits	Name	Description
0	em_type	1'b0: Generate control signals for Flow through Sync SRAM (CY7C1324H). 1'b1: Generate control signals for Async SRAM (CY7C1041D).

1.3.342   EMIF_WP_WAIT_STATES

External Memory Interface Write Path Wait States Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

EMIF_WP_WAIT_STATES: 0x40005406

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					wp_wait_states		

This register configures the additional wait states for write operation. In the table, reserved bits are grayed table cells and are not described in the bit description section below. Reserved bits should always be written with a value of '0'.

Bits	Name	Description
2:0	wp_wait_states[2:0]	In NO_UDB mode the following table determines the minimum number of additional clock cycles (wait states) required to complete the external write operation (this table assumes EMIF_MEMCLK_DIV is programmed correctly relative to f(HCLK)): 0 <= f(HCLK) <= 28: WP_WAIT_STATES can be 0 or more 28 < f(HCLK) <= 33: WP_WAIT_STATES must be >= 1 33 < f(HCLK) <= 61: WP_WAIT_STATES can be 0 or more 61 < f(HCLK) <= 67: WP_WAIT_STATES must be >= 1 67 < f(HCLK) <= 81: WP_WAIT_STATES can be 0 or more 81 < f(HCLK) <= 99: WP_WAIT_STATES must be >= 1

1.3.343   SC[0..3]_CR0

Switched Capacitor Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC0_CR0: 0x40005800   SC1_CR0: 0x40005804

SC2_CR0: 0x40005808   SC3_CR0: 0x4000580C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:00		R/W:000			NA:0
HW Access	NA		R		R			NA
Retention	NA		RET		RET			NA
Name	RSVD		dft		mode			RSVD

Bits	Name	Description
5:4	dft[1:0]	Enables DFT mode for the switch cap block
		See Table 1-156.
3:1	mode[2:0]	Configuration select for the SC block
		See Table 1-157.

Table 1-156. Bit field encoding: SC_DFT_ENUM

Value	Name	Description
2'h0	SC_DFT_NORMAL	Normal Operation
2'h1	SC_DFT_VBOOST	Vboost DFT
2'h2	SC_DFT_MODE_DEPENDENT	Mode Dependent (PGA Mode = Voltage Integrator, TIA Mode = Charge Integrator, Naked Opamp Mode = Comparator)
2'h3	SC_DFT_RESET	DFT Rreset

Table 1-157. Bit field encoding: SC_MODE_ENUM

Value	Name	Description
3'b000	SC_MODE_NAKED_OPAMP	Naked Op-Amp
3'b001	SC_MODE_TIA	Transimpedance Amplifier (TIA)
3'b010	SC_MODE_CTMIXER	Continuous Time Mixer
3'b011	SC_MODE_NRZ_SH	Discrete Time Mixer - NRZ S/H
3'b100	SC_MODE_UNITY	Unity Gain Buffer
3'b101	SC_MODE_1ST_MOD	First Order Modulator
3'b110	SC_MODE_PGA	Programmable Gain Amplifier (PGA)
3'b111	SC_MODE_TRACKANDHOLD	Track and Hold

1.3.344 SC[0..3]_CR1

Switched Capacitor Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC0_CR1: 0x40005801   SC1_CR1: 0x40005805

SC2_CR1: 0x40005809   SC3_CR1: 0x4000580D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:00		R/W:00	
HW Access	NA		R	R	R		R	
Retention	NA		RET	RET	RET		RET	
Name	RSVD		gain	div2	comp		drive	

Bits	Name	Description
5	gain	Controls the ratio of the feedback cap for S/H Mixer mode and PGA mode See Table 1-161.
4	div2	When 0, the sample clock only needs to be half the desired sample frequency for S/H Mixer mode See Table 1-159.
3:2	comp[1:0]	Selects between various compensation capacitor sizes See Table 1-158.
1:0	drive[1:0]	Selects between current settings (I_Load (uA)) in the output buffer See Table 1-160.

Table 1-158. Bit field encoding: SC_COMP_ENUM

Value	Name	Description
2'b00	SC_COMP_3P0PF	3.0pF
2'b01	SC_COMP_3P6PF	3.6pF
2'b10	SC_COMP_4P35PF	4.35pF
2'b11	SC_COMP_5P1PF	5.1pF

Table 1-159. Bit field encoding: SC_DIV2_ENUM

Value	Name	Description
1'b0	SC_DIV2_DISABLE	no frequency division
1'b1	SC_DIV2_ENABLE	SC CLK is divided by two

Table 1-160. Bit field encoding: SC_DRIVE_ENUM

Value	Name	Description
2'b00	I_LOAD_175UA	175 uA
2'b01	I_LOAD_260UA	260 uA
2'b10	I_LOAD_330UA	330 uA
2'b11	I_LOAD_400UA	400 uA

Table 1-161. Bit field encoding: SC_GAIN_ENUM

Value	Name	Description

1.3.344   SC[0..3]_CR1 (continued)

Table 1-161. Bit field encoding: SC_GAIN_ENUM

1'b0	GAIN_0DB	0 dB
1'b1	GAIN_6DB	6 dB

1.3.345 SC[0..3]_CR2

Switched Capacitor Control Register 2

Reset:　　　System reset for retention flops [reset_all_retention]

1.3.354 LCDDAC_CR0

LCD Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_CR0: 0x40005868

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:000			R/W:0	NA:0	R/W:00	
HW Access	R	NA			R	NA	R	
Retention	RET	NA			RET	NA	RET	
Name	lp_en	RSVD			continous_drive	RSVD	bias_sel	

Bits	Name	Description
7	lp_en	Setting this bit allows the UDB to gate the Low Power Ack for the LCD Subsystem (lcd_lp_ack_n); When set to 0, the LCD subsystem LP ack is directly driven by the lpreq from the power manager
		See Table 1-187.
3	continous_drive	This bit allows the LCDDAC to remain active when the chip goes to sleep. In this mode, the LCDDAC drives the LCD pins while the LCD Driver is in bypass mode
		See Table 1-186.
1:0	bias_sel[1:0]	Selects the LCD bias/multiplex ratio
		See Table 1-185.

Table 1-185. Bit field encoding: LCDDAC_BIAS_SELECT_ENUM

Value	Name	Description
2'b00	LCDDAC_BIAS_SELECT_1DIV3	v0=2.0-supply; v1=0.666*v0; v2=0.333*v0; v3=0.666*v0; v4=0.333*v0; Multiplex ratios=2:1,3:1,4:1
2'b01	LCDDAC_BIAS_SELECT_1DIV4	v0=2.0-supply; v1=0.750*v0; v2=0.500*v0; v3=0.500*v0; v4=0.250*v0; Multiplex ratio=8:1
2'b10	LCDDAC_BIAS_SELECT_1DIV5	v0=2.0-supply; v1=0.800*v0; v2=0.600*v0; v3=0.400*v0; v4=0.200*v0; Multiplex ratio=16:1
2'b11	LCDDAC_BIAS_SELECT_1DIV5_ALSO	v0=2.0-supply; v1=0.800*v0; v2=0.600*v0; v3=0.400*v0; v4=0.200*v0; Multiplex ratio=16:1

Table 1-186. Bit field encoding: LCDDAC_CONTINUOUS_DRIVE_ENUM

Value	Name	Description
1'b0	LCDDAC_CONTINUOUS_DRIVE_CANCATCHZZZ	LCDDAC is powered down when the chip is in sleep
1'b1	LCDDAC_CONTINUOUS_DRIVE_LIVINGDEAD	LCDDAC is active when the chip is in sleep

1.3.355 LCDDAC_CR1

LCDDAC Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_CR1: 0x40005869

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:000000					
HW Access	NA	R	R					
Retention	NA	RET	RET					
Name	RSVD	nc	contrast_ctl					

Bits	Name	Description
6	nc	Not connected
5:0	contrast_ctl[5:0]	LCD Contrast control setting. Bit6 Not Connected; Step size is 27.3 mV @ 3.0 V supply and 50 mV @ 5.5 V supply; Min V0 should be 2 V. To achieve this, use code value 6'h00 for 5.5 V supply and 6'h21 for 3 V supply. Max V0 is equal to supply level for code value 6'h3f See Table 1-188.

Table 1-188. Bit field encoding: LCDDAC_D_ENUM

Value	Name	Description
6'h0	LCDDAC_D_MIN	Minimum
6'h3f	LCDDAC_D_MAX	Max

1.3.356 LCDDRV_CR

LCD Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDRV_CR: 0x4000586A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			bypass_en	pts	invert	mode_0	dispblnk

Bits	Name	Description
4	bypass_en	This bit enables bypassing the LCD Driver, so that the LCDDAC is driving the LCD glass. The LCDDAC continuous_drive bit is also set to allow the LCDDAC to remain active when the chip goes to sleep. See Table 1-189.
3	pts	pts (pull-to-supply) signal enables the LCD Driver to be able to drive to supply level. In normal operation, the ouput of the LCD Driver is limited to VIO-0.5V whereas when the pts mode is enabled, the output can reach to VIO. See Table 1-193.
2	invert	Invert LCD Display (invert display data on all pins configured as segments) See Table 1-191.

1.3.356 **LCDDRV_CR** (continued)

1	mode_0	LCD Driver mode[0];(mode[2:1] come from DSI)
		There are two modes associated with the LCD Drive: High Drive and Low Drive.
		High Drive mode is used in most applications to refresh or to write new data to the LCD glass. This mode comes with a variety of different drive strengths to save power and reduce AC coupling.
		In some applications, drivers on the common lines will face more of a load than drivers on the segment lines. In those cases, the drive strength on the common lines should be increased.
		Additionally, in an effort to reduce AC coupling, the common drivers should generally be stronger than the segment drivers. This is assuming the number of common pins is less than the number of segment pins.
		In cases of large glass size where the number of common pins are close to or equal to the number of segment pins, a configuration of com=4x and seg=4x should be used in order to reduce the overall charge times.
		Low Drive mode is used to sustain the voltage on the LCD in the case of high leakage applications.
		In the case of extreme leakage applications due to the glass type used, the overall glass size, or environmental temperature of the glass, a stronger Low Drive mode can be used at the cost of slightly higher power consumption.
		Control Bits Mode Drive Strength
		mode[2:0]
		000 HiDrive seg=1x, com=1x
		001 HiDrive seg=1x, com=2x
		010 HiDrive seg=1x, com=4x
		011 HiDrive seg=2x, com=2x
		100 HiDrive seg=2x, com=4x
		101 HiDrive seg=4x, com=4x
		110 LoDrive seg=1x, com=1x
		111 LoDrive seg=2x, com=2x
		See Table 1-192.
0	dispblnk	LCD Display Blank
		See Table 1-190.

Table 1-189. Bit field encoding: LCD_BYPASS_EN_ENUM

Value	Name	Description
1'b0	LCD_BYPASS_EN_LCD DRV_DRIVES_GLASS	Normal mode
1'b1	LCD_BYPASS_EN_LCD DAC_DRIVES_GLASS	Bypass mode

Table 1-190. Bit field encoding: LCD_DISPBLNK_ENUM

Value	Name	Description
1'b0	LCD_DISPBLNK_HIZ	When in a low power mode, set output buffer in LCD Drivers to hi impedance. This leaves intact the last image driven to the LCD display (charge will slowly leak off and the image will fade unless updated).
1'b1	LCD_DISPBLNK_BLAN K	When in a low power mode, set output buffer in LCD Drivers to ground. Blanks the LCD display.

Table 1-191. Bit field encoding: LCD_INVERT_ENUM

Value	Name	Description
1'b0	LCD_INVERT_DISABLE D	Normal display
1'b1	LCD_INVERT_ENABLE D	Inverted display

1.3.356   LCDDRV_CR (continued)

Table 1-192. Bit field encoding: LCD_MODE_0_ENUM

Value	Name	Description
1'b0	LCD_MODE_0_0	Depends on other signals
1'b1	LCD_MODE_0_1	Depends on other signals

Table 1-193. Bit field encoding: LCD_PTS_ENUM

Value	Name	Description
1'b0	LCD_PTS_0	normal operation, VOUT = VIO-0.5V
1'b1	LCD_PTS_1	pts mode enabled, VOUT = VIO

Bits	Name	Description
7	fcap2_en	Enable/Disable additional 50fF capacitance path in the second integrators integrating capacitance path See Table 1-249.
6	fcap3_en	Enable/Disable additonal capacitance path in the third integrator's integrating capacitance path See Table 1-250.
5	ipcap1offset	Offset capacitance for the input sampling capacitance in the first stage integrator See Table 1-251.
4	fcap1offset	Offset Capacitance for the integrating capacitance in the first stage integrator See Table 1-248.

Table 1-248. Bit field encoding: FCAP1OFFSET_ENUM

Value	Name	Description
1'b0	FCAP1OFFSET_0	Don't add offset capacitance
1'b1	FCAP1OFFSET_1	Add offset capacitance of 3.4 pF

Table 1-249. Bit field encoding: FCAP2_EN_ENUM

Value	Name	Description
1'h0	FCAP2_EN_DISABLE	Disable the additonal 50fF capacitance path
1'h1	FCAP2_EN_ENABLE	Enable the additonal 50fF capacitance path

Table 1-250. Bit field encoding: FCAP3_EN_ENUM

Value	Name	Description
1'h0	FCAP3_EN_DISABLE	Disable the additonal 100fF capacitance path
1'h1	FCAP3_EN_ENABLE	Enable the 100fF capacitance path

Table 1-251. Bit field encoding: IPCAP1OFFSET_ENUM

Value	Name	Description
1'b0	IPCAP1OFFSET_0	Don't add offset capacitance
1'b1	IPCAP1OFFSET_1	Add offset capacitance of 4.8 pF

Retention	RET		RET		RET		RET	RET
Name	pwr_ctrl_vref_inn		pwr_ctrl_vcm		pwr_ctrl_vref		en_buf_vcm	en_buf_vref

Bits	Name	Description
7:6	pwr_ctrl_vref_inn[1:0]	Power control modes for REFBUF1 (the reference buffer that connects ADC reference to the negative input MUX of the channel)
		See Table 1-278.
5:4	pwr_ctrl_vcm[1:0]	Power Control for the Voltage Common Mode Buffer for the Sigma Delta ADC
		See Table 1-276.
3:2	pwr_ctrl_vref[1:0]	Power Control for the Voltage Reference Buffer for the Sigma Delta ADC
		See Table 1-277.
1	en_buf_vcm	Enable/Disable control for ADC (Internal)Reference Buffer
		See Table 1-274.
0	en_buf_vref	Enable/Disable control for ADC (Internal)Reference Buffer
		See Table 1-275.

Table 1-274. Bit field encoding: EN_BUF_VCM_ENUM

Value	Name	Description
1'h0	EN_BUF_VCM_0	The ADC Output common mode (VCM) voltage buffer is powered down
1'h1	EN_BUF_VCM_1	The ADC Output common mode (VCM) voltage buffer is NOT powered down

Table 1-275. Bit field encoding: EN_BUF_VREF_ENUM

Value	Name	Description
1'h0	EN_BUF_VREF_0	The Internal Reference Voltage Buffer is powered down
1'h1	EN_BUF_VREF_1	The Internal Reference Voltage Buffer is NOT powered down

Table 1-276. Bit field encoding: PWR_CTRL_VCM_ENUM

Value	Name	Description
2'h0	PWR_CTRL_VCM_0	VCM Buffer is operating in Low Power (18 uA) mode
2'h1	PWR_CTRL_VCM_1	VCM Buffer is operating in Medium Power (28 uA) mode
2'h2	PWR_CTRL_VCM_2	VCM Buffer is operating in High Power (55 uA) mode
2'h3	PWR_CTRL_VCM_3	VCM Buffer is operating in Turbo Power (114 uA) mode

Table 1-277. Bit field encoding: PWR_CTRL_VREF_ENUM

Value	Name	Description

1.3.390   DSM[0..0]_CR17 (continued)

Table 1-277. Bit field encoding: PWR_CTRL_VREF_ENUM

2'h0	PWR_CTRL_VREF_0	VREF Buffer is operating in Low Power (26 uA) mode
2'h1	PWR_CTRL_VREF_1	VREF Buffer is operating in Medium Power (32 uA) mode
2'h2	PWR_CTRL_VREF_2	VREF Buffer is operating in High Power (118 uA) mode
2'h3	PWR_CTRL_VREF_3	VREF Buffer is operating in Turbo Power (232 uA) mode

Table 1-278. Bit field encoding: PWR_CTRL_VREF_INN_ENUM

Value	Name	Description
2'h0	PWR_CTRL_VREF_INN _LOW	VREF Buffer (Input mux path) is operating in Low Power (26uA) mode
2'h1	PWR_CTRL_VREF_INN _MEDIUM	VREF Buffer (Input mux path) is operating in Medium Power (32uA) mode
2'h2	PWR_CTRL_VREF_INN _HIGH	VREF Buffer (Input mux path) is operating in High Power (118uA) mode
2'h3	PWR_CTRL_VREF_INN _TURBO	VREF Buffer (Input mux path) is operating in Turbo Power (232uA) mode

1.3.391   DSM[0..0]_REF0

Delta Sigma Modulator Reference Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DSM0_REF0: 0x40005892

HW Access	R		NA	R	R	R		
Retention	RET		NA	RET	RET	RET		
Name	vcmsel		RSVD	vref_res_div _en	en_buf_vref _inn	refmux		

Bits	Name	Description
7:6	vcmsel[1:0]	Output common mode selection for modulator See Table 1-280.
4	vref_res_div_en	If enabled it allows the resistor divided value of (VDDA/3 or VDDA/4) to a selectable voltage for the RefMux
3	en_buf_vref_inn	Enable/Disable control for ADC (internal) REFBUF1 Buffer; This buffers the ADC reference before being sent to INN Mux; See IROS DSM chapter
2:0	refmux[2:0]	Mux control that allows for selecting one among the various available internal reference values See Table 1-279.

Table 1-279. Bit field encoding: REFMUX_ENUM

Value	Name	Description
3'h0	REFMUX_0	No Selection made for VCM
3'h1	REFMUX_1	VDAC0 output is the reference for the DSM
3'h2	REFMUX_2	VDDA/4 is selected as the reference for the DSM (VDDA is the external voltage supply)
3'h3	REFMUX_3	VDDA/3 is selected as the reference for the DSM (VDDA is the external voltage supply)
3'h4	REFMUX_4	internal precision bandgap reference of 1.024 (typ) is selected as the DSM reference
3'h5	REFMUX_5	internal precision bandgap reference of 1.2V (typ) is selected as the DSM reference
3'h6	REFMUX_6	N/A
3'h7	REFMUX_7	N/A

Table 1-280. Bit field encoding: VCMSEL_ENUM

Value	Name	Description
2'h0	VCMSEL_0	No selection is made for VCM
2'h1	VCMSEL_1	0.8V from bandgap trim buffer is being selected as VCM (output common mode) for the DSM opamps
2'h2	VCMSEL_2	0.7V from bandgap trim buffer is being selected as VCM (output common mode)
2'h3	VCMSEL_3	Vssd being selected as VCM (output common mode) for the DSM opamps

Table 1-285. Bit field encoding: EN_SCRAMBLER0_ENUM

1'h1	EN_SCRAMBLER0_EN ABLE	Enable Scrambler 0

Table 1-286. Bit field encoding: EN_SCRAMBLER1_ENUM

Value	Name	Description
1'h0	EN_SCRAMBLER1_DIS ABLE	Disable Scrambler 1
1'h1	EN_SCRAMBLER1_EN ABLE	Enable Scrambler 1

1.3.396   DSM[0..0]_DEM1

Delta Sigma Modulator Dynamic Element Matching Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DSM0_DEM1: 0x40005897

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	demtest							

Bits	Name	Description
7:0	demtest[7:0]	Register control for the DAC unit elements inside the first integrator. This can be used when bit DSM.DEM0[3], adc_test_en, is set. If the adc_test_en is not set the the control logic inside the modulator determines how the DAC unit elements are controlled. This is meant for static testing purposes

1.3.397   DSM[0..0]_TST0

Delta Sigma Modulator Test Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DSM0_TST0: 0x40005898

SW Access:Reset	NA:0	R/W:000			R/W:0000			
HW Access	NA	R			R			
Retention	NA	RET			RET			
Name	RSVD	dig_test_sel			refsel_ctrl			

Bits	Name	Description
6:4	dig_test_sel[2:0]	To test various digital outputs to digital muxes (for DFT) See Table 1-287.
3:0	refsel_ctrl[3:0]	This is the 4-bit encoded value which selects one among the 15 important DFT observable points inside the DSM. 4'h0 (0000) through 4'ha (1010) selects between various tap points in the quantizer resistor ladder. 4'hb (1011) through 4'he (1110) selects special points inside the DSM See Table 1-288.

Table 1-287. Bit field encoding: DIG_TEST_SEL_ENUM

Value	Name	Description
3'h0	DIG_TEST_SEL_0	test_dig_out = vhi
3'h1	DIG_TEST_SEL_1	test_dig_out = hi
3'h2	DIG_TEST_SEL_2	test_dig_out = med
3'h3	DIG_TEST_SEL_3	test_dig_out = low
3'h4	DIG_TEST_SEL_4	test_dig_out = sign
3'h5	DIG_TEST_SEL_5	test_dig_out = reset_ov
3'h6	DIG_TEST_SEL_6	test_dig_out = TESTMODE & Phi1 (sampling clock phase)
3'h7	DIG_TEST_SEL_7	test_dig_out = TESTMODE & fchclk (chopping clock)

Table 1-288. Bit field encoding: REFSEL_CTRL_ENUM

Value	Name	Description
4'h0	REFSEL_CTRL_0	(9/32)*Vref
4'h1	REFSEL_CTRL_1	(11/32)*Vref
4'h2	REFSEL_CTRL_2	(12/32)*Vref
4'h3	REFSEL_CTRL_3	(13/32)*Vref
4'h4	REFSEL_CTRL_4	(15/32)*Vref
4'h5	REFSEL_CTRL_5	(16/32)*Vref
4'h6	REFSEL_CTRL_6	(17/32)*Vref
4'h7	REFSEL_CTRL_7	(19/32)*Vref
4'h8	REFSEL_CTRL_8	(20/32)*Vref
4'h9	REFSEL_CTRL_9	(21/32)*Vref
4'ha	REFSEL_CTRL_10	(23/32)*Vref
4'hb	REFSEL_CTRL_11	Selects VICM (Input Common Mode) applied to DSM to be available at Ref_out DFT point
4'hc	REFSEL_CTRL_12	Selects Vb0 (2nd and 3rd integrator Opamp Bias Voltage) inside the DSM to Ref_out DFT point

1.3.397 DSM[0..0]_TST0 (continued)

Table 1-288. Bit field encoding: REFSEL_CTRL_ENUM

4'hd	REFSEL_CTRL_13	Selects VRCM (Half of applied Reference) inside the DSM to Ref_out DFT point
4'he	REFSEL_CTRL_14	Selects vbias0_int, an internal bias point from inside the DSM to Ref_out DFT point
4'hf	REFSEL_CTRL_15	Not a valid selection

Name	icont		reset_soft	coherency_en	hiz	mx_sof	sof_mode	sof_bit

Bits	Name	Description
7:6	icont[1:0]	current control
		See Table 1-301.
5	reset_soft	firmware reset (not autoclearing) - can be used to stop a conversion
		See Table 1-305.
4	coherency_en	Coherency Locking enable
		See Table 1-302.
3	hiz	Sample time HiZ
		See Table 1-303.
2	mx_sof	Start-of-Frame (sof) source selection
		See Table 1-304.
1	sof_mode	Start-of-Frame (sof) mode
		See Table 1-307.
0	sof_bit	Start-of-Frame (sof) register source; enable conversion; (NOTE: autoclearing upon receipt of eof_sync when sof_mode==edge-sensitive)
		See Table 1-306.

Table 1-301. Bit field encoding: ICONT_ENUM

Value	Name	Description
2'h0	ICONT_0	Normal power mode (typical comparator current=200uA), clk > 4.5Mhz
2'h1	ICONT_1	1/2 of normal power, 2.25Mhz < clk < 4.5Mhz
2'h2	ICONT_2	1.25 times normal power (Risk mitigation only, not used)
2'h3	ICONT_3	1/4 of normal power (clk < 2.25Mhz)

Table 1-302. Bit field encoding: SAR_COHERENCY_EN_ENUM

Value	Name	Description
1'b0	SAR_COHERENCY_EN_NOLOCK	Coherency locking off

1.3.405   SAR[0..1]_CSR0 (continued)

Table 1-302. Bit field encoding: SAR_COHERENCY_EN_ENUM

1'b1	SAR_COHERENCY_EN_LOCK	Coherency Locking on Coherency locking blocks SAR data output registers if only one of the two registers has been read

Table 1-303. Bit field encoding: SAR_HIZ_ENUM

Value	Name	Description
1'b0	SAR_HIZ_CLEAR	Should not be used
1'b1	SAR_HIZ_RETAIN	Higher input impedance mode, caps not reset after conversion

Table 1-304. Bit field encoding: SAR_MX_SOF_ENUM

Value	Name	Description
1'b0	SAR_MX_SOF_BIT	source: sof_bit
1'b1	SAR_MX_SOF_UDB	source: UDB

Table 1-305. Bit field encoding: SAR_RESET_SOFT_ENUM

Value	Name	Description
1'b0	SAR_RESET_SOFT_NOTACTIVE	reset soft not active
1'b1	SAR_RESET_SOFT_ACTIVE	reset soft active

Table 1-306. Bit field encoding: SAR_SOF_BIT_ENUM

Value	Name	Description
1'b0	SAR_SOF_BIT_0	disable conversion
1'b1	SAR_SOF_BIT_1	Enable conversion

Table 1-307. Bit field encoding: SAR_SOF_MODE_ENUM

Value	Name	Description
1'b0	SAR_SOF_MODE_LEVEL	level-sensitive sof source
1'b1	SAR_SOF_MODE_EDGE	edge-sensitive sof source

1.3.406   SAR[0..1]_CSR1

SAR status and control register 1

Reset: Reset Signals Listed Below

Register : Address

SAR0_CSR1: 0x40005901   SAR1_CSR1: 0x40005909

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:000			R/W:0	R/W:0	R/W:0	R/W:0	RC:0
HW Access	R			R	R	R	R	R/W
Retention	RET			RET	RET	RET	RET	NONRET
Name	muxref			swvp_src	swvn_src	irq_mode	irq_mask	eof

Bits	Name	Description
7:5	muxref[2:0]	SAR reference mux control See Table 1-311.
4	swvp_src	SAR positive input routing control source See Table 1-313.
3	swvn_src	SAR negative input routing control source See Table 1-312.
2	irq_mode	interrupt mode See Table 1-310.
1	irq_mask	Enable interrupt request from eof See Table 1-309.
0	eof	End Of Frame - clear-on-read sticky bit See Table 1-308.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	irq_mask, irq_mode, swvn_src, swvp_src, muxref[2:0]
Domain reset for non-retention flops [reset_all_nonretention]	eof

Table 1-308. Bit field encoding: SAR_EOF_ENUM

Value	Name	Description
1'b0	SAR_EOF_0	data_out NOT new
1'b1	SAR_EOF_1	End-of-Frame; data_out new

Table 1-309. Bit field encoding: SAR_IRQ_MASK_ENUM

Value	Name	Description
1'b0	SAR_IRQ_MASK_DIS	disabled
1'b1	SAR_IRQ_MASK_EN	enabled

1.3.406 SAR[0..1]_CSR1 (continued)

Table 1-310. Bit field encoding: SAR_IRQ_MODE_ENUM

Value	Name	Description
1'b0	SAR_IRQ_MODE_LEVEL	level
1'b1	SAR_IRQ_MODE_EDGE	edge

Table 1-311. Bit field encoding: SAR_MUXREF_ENUM

Value	Name	Description
3'h0	SAR_MUXREF_0	Not Used
3'h1	SAR_MUXREF_1	Not Used
3'h2	SAR_MUXREF_2	vda/2 (also set en_resvda bit in CSR3)
3'h3	SAR_MUXREF_3	vdac
3'h4	SAR_MUXREF_4	BG vref1 (1.024V)
3'h5	SAR_MUXREF_5	BG vref2 (1.2V)
3'h6	SAR_MUXREF_6	Not Used
3'h7	SAR_MUXREF_7	Not Used

Table 1-312. Bit field encoding: SAR_SWVN_SRC_ENUM

Value	Name	Description
1'b0	SAR_SWVN_SRC_REG	ANAIF SAR routing registers
1'b1	SAR_SWVN_SRC_UDB	UDB

Table 1-313. Bit field encoding: SAR_SWVP_SRC_ENUM

Value	Name	Description
1'b0	SAR_SWVP_SRC_REG	ANAIF SAR routing registers
1'b1	SAR_SWVP_SRC_UDB	UDB

1.3.407 SAR[0..1]_CSR2

SAR status and control register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SAR0_CSR2: 0x40005902   SAR1_CSR2: 0x4000590A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:000			R/W:000		
HW Access	R		R			R		
Retention	RET		RET			RET		
Name	resolution		sample_width_msb			sample_width_lsb		

Bits	Name	Description
7:6	resolution[1:0]	8b,10b,12b resolution selection (data_out is LSBit aligned (right-shifted) according to the resolution mode) See Table 1-314.
5:3	sample_width_msb[2:0]	Sample time down counter start value MSB See Table 1-316.
2:0	sample_width_lsb[2:0]	Sample time down counter start value LSB See Table 1-315.

Table 1-314. Bit field encoding: SAR_RESOLUTION_ENUM

Value	Name	Description
2'h0	SAR_RESOLUTION_12 BIT_DEFAULT	12-bit conversion = data_out[11:0]
2'h1	SAR_RESOLUTION_8BI T	8-bit conversion = data_out[7:0] (data_out[11:8] = 4'b0)
2'h2	SAR_RESOLUTION_10 BIT	10-bit conversion = data_out[9:0] (data_out[11:10] = 2'b0)
2'h3	SAR_RESOLUTION_12 BIT_ALSO	12-bit conversion = data_out[11:0]

Table 1-315. Bit field encoding: SAR_SAMPLE_WIDTH_LSB_ENUM

Value	Name	Description
3'h0	SAR_SAMPLE_WIDTH_ LSB_0	sample time=MSB value*clock period; cannot be used of MSB is 0
3'h1	SAR_SAMPLE_WIDTH_ LSB_1	sample time=MSB value + 1 clock cycle
3'h2	SAR_SAMPLE_WIDTH_ LSB_2	sample time=MSB value + 2 clock cycle
3'h3	SAR_SAMPLE_WIDTH_ LSB_3	sample time=MSB value + 3 clock cycle
3'h4	SAR_SAMPLE_WIDTH_ LSB_4	sample time=MSB value + 4 clock cycle
3'h5	SAR_SAMPLE_WIDTH_ LSB_5	sample time=MSB value + 5 clock cycle

1.3.407 SAR[0..1]_CSR2 (continued)

Table 1-315. Bit field encoding: SAR_SAMPLE_WIDTH_LSB_ENUM

3'h6	SAR_SAMPLE_WIDTH_LSB_6	sample time=MSB value + 6 clock cycle
3'h7	SAR_SAMPLE_WIDTH_LSB_7	sample time=MSB value + 7 clock cycle

Table 1-316. Bit field encoding: SAR_SAMPLE_WIDTH_MSB_ENUM

Value	Name	Description
3'h0	SAR_SAMPLE_WIDTH_MSB_0	sample time=LSB value * clock period; cannot be used of LSB is 0
3'h1	SAR_SAMPLE_WIDTH_MSB_1	sample time=LSB value + 128 clock cycles
3'h2	SAR_SAMPLE_WIDTH_MSB_2	sample time=LSB value + 256 clock cycles
3'h3	SAR_SAMPLE_WIDTH_MSB_3	sample time=LSB value + 384 clock cycles
3'h4	SAR_SAMPLE_WIDTH_MSB_4	sample time=LSB value + 512 clock cycles
3'h5	SAR_SAMPLE_WIDTH_MSB_5	sample time=LSB value + 640 clock cycles
3'h6	SAR_SAMPLE_WIDTH_MSB_6	sample time=LSB value + 768 clock cycles
3'h7	SAR_SAMPLE_WIDTH_MSB_7	sample time=LSB value + 896 clock cycles

1.3.408   SAR[0..1]_CSR3

SAR status and control register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SAR0_CSR3: 0x40005903   SAR1_CSR3: 0x4000590B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:00		R/W:00		R/W:0	R/W:0
HW Access	NA	R	R		R		R	R
Retention	NA	RET	RET		RET		RET	RET
Name	RSVD	en_resvda	pwr_ctrl_vcm		pwr_ctrl_vref		en_buf_vcm	en_buf_vref

Bits	Name	Description
6	en_resvda	Enable SAR vda resister ladder divider
		See Table 1-319.
5:4	pwr_ctrl_vcm[1:0]	SAR VCM reference power control
		See Table 1-320.
3:2	pwr_ctrl_vref[1:0]	SAR VREF reference power control
		See Table 1-321.
1	en_buf_vcm	Enable SAR VCM reference buffer
		See Table 1-317.
0	en_buf_vref	Enable SAR VREF reference buffer
		See Table 1-318.

Table 1-317. Bit field encoding: SAR_EN_BUF_VCM_ENUM

Value	Name	Description
1'b0	SAR_EN_BUF_VCM_DIS	disable internal common mode buffer
1'b1	SAR_EN_BUF_VCM_EN	enable internal common mode buffer, always ON when SAR is functional

Table 1-318. Bit field encoding: SAR_EN_BUF_VREF_ENUM

Value	Name	Description
1'b0	SAR_EN_BUF_VREF_DIS	disabled
1'b1	SAR_EN_BUF_VREF_EN	enabled

Table 1-319. Bit field encoding: SAR_EN_RESVDA_ENUM

Value	Name	Description
1'b0	SAR_EN_RESVDA_DIS	VDDA/2 divider disabled
1'b1	SAR_EN_RESVDA_EN	VDDA/2 divider enabled (for reference = Vdda/2)

1.3.408　SAR[0..1]_CSR3 (continued)

Table 1-320. Bit field encoding: SAR_PWR_CTRL_VCM_ENUM

Value	Name	Description
2'h0	SAR_PWR_CTRL_VCM_0	Not used
2'h1	SAR_PWR_CTRL_VCM_1	Not used
2'h2	SAR_PWR_CTRL_VCM_2	Not used
2'h3	SAR_PWR_CTRL_VCM_3	Not used

Table 1-321. Bit field encoding: SAR_PWR_CTRL_VREF_ENUM

Value	Name	Description
2'h0	SAR_PWR_CTRL_VREF_0	Normal power mode (typical current=180uA)
2'h1	SAR_PWR_CTRL_VREF_1	Half power mode
2'h2	SAR_PWR_CTRL_VREF_2	1/3rd power mode
2'h3	SAR_PWR_CTRL_VREF_3	1/4th power mode

1.3.409 SAR[0..1]_CSR4

SAR status and control register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

Name	RSVD	dft_outc_2	dft_outc_1	dft_outc_0	dft_inc_3	dft_inc_2	dft_inc_1	dft_inc_0

Bits	Name	Description
6	dft_outc_2	DFT observe point enable See Table 1-323.
5	dft_outc_1	DFT observe point enable See Table 1-323.
4	dft_outc_0	DFT observe point enable See Table 1-323.
3	dft_inc_3	DFT control point enable See Table 1-322.
2	dft_inc_2	DFT control point enable See Table 1-322.
1	dft_inc_1	DFT control point enable See Table 1-322.
0	dft_inc_0	DFT control point enable See Table 1-322.

Table 1-322. Bit field encoding: SAR_DFT_INC_ENUM

Value	Name	Description
1'b0	SAR_DFT_INC_DISABLED	dft control point disabled
1'b1	SAR_DFT_INC_ENABLED	dft control point enabled

Table 1-323. Bit field encoding: SAR_DFT_OUTC_ENUM

Value	Name	Description
1'b0	SAR_DFT_OUTC_DISABLED	dft observe point disabled
1'b1	SAR_DFT_OUTC_ENABLED	dft observe point enabled

1.3.410   SAR[0..1]_CSR5

SAR status and control register 5

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SAR0_CSR5: 0x40005905   SAR1_CSR5: 0x4000590D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0000			
HW Access	R	R	R	R	R			
Retention	RET	RET	RET	RET	RET			
Name	overrun_det_en	dly_inc	dcen	en_csel_dft	sel_csel_dft			

Bits	Name	Description
7	overrun_det_en	Enable data overrun detection
		See Table 1-327.
6	dly_inc	Control for delay circuits
		See Table 1-325.
5	dcen	Short AC coupling in comparator for DFT
		See Table 1-324.
4	en_csel_dft	Enable for sel_csel_dft
		See Table 1-326.
3:0	sel_csel_dft[3:0]	To use this test value set en_csel_dft Additional info: sel_csel_dft[1:0] is also used for power/delay control options
		See Table 1-328.

Table 1-324. Bit field encoding: SAR_DCEN_ENUM

Value	Name	Description
1'b0	SAR_DCEN_0	Delay control for comparator latch enable, high delay (Always used)
1'b1	SAR_DCEN_1	Delay control for comparator latch enable, low delay (Not used)

Table 1-325. Bit field encoding: SAR_DLY_INC_ENUM

Value	Name	Description
1'b0	SAR_DLY_INC_0	low non-overlap delay for sampling clock signals (for 1M SPS)
1'b1	SAR_DLY_INC_1	high non-overlap delay for sampling clock signals (for <500K SPS)

Table 1-326. Bit field encoding: SAR_EN_CSEL_DFT_ENUM

Value	Name	Description
1'b0	SAR_EN_CSEL_DFT_DISABLED	Normal mode
1'b1	SAR_EN_CSEL_DFT_ENABLED	Test mode; sel_csel_dft[3:0] used

1.3.410   SAR[0..1]_CSR5 (continued)

Table 1-327. Bit field encoding: SAR_OVERRUN_DET_EN_ENUM

Value	Name	Description
1'b0	SAR_OVERRUN_DET_ EN_DIS	disabled
1'b1	SAR_OVERRUN_DET_ EN_EN	enabled

Table 1-328. Bit field encoding: SAR_SEL_CSEL_DFT_ENUM

Value	Name	Description
4'h0	SAR_SEL_CSEL_DFT_ MIN	sel_csel_dft[0]:0 - Normal mode, 1-Increase comparator latch enable delay by 20%
4'hf	SAR_SEL_CSEL_DFT_ MAX	sel_csel_dft[1]:0 - Normal mode, 1-Increase comparator bias current by 30% without impacting delays

1.3.411   SAR[0..1]_CSR6

SAR status and control register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SAR0_CSR6: 0x40005906   SAR1_CSR6: 0x4000590E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	ref_s							

Bits	Name	Description
7:0	ref_s[7:0]	Enable reference switch. ref_s[6:5], ref_s[1:0] are unused. Refer to SAR section of the TRM Book1 for details
		See Table 1-329.

Table 1-329. Bit field encoding: SAR_REF_S_ENUM

Value	Name	Description
8'h04	EXT_VREF	External Vref when SAR[0..1]_CSR3[0] is set to 1'b0
8'h18	INT_VREF1	Internal Vref with no bypass cap when SAR[0..1]_CSR3[0] is set to 1'b1
8'h04	INT_VREF2	Internal reference with bypass cap when SAR[0..1]_CSR3[0] is set to 1'b1
8'h80	VDDA_VREF	Vdda as reference when SAR[0..1]_CSR3[0] is set to 1'b0

6	vo_ag6	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-367.
4	vo_ag4	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-367.
2	vo_ag2	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-367.
0	vo_ag0	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-367.

Table 1-367. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.439 SC2_SW10

Switched Capacitor Analog Routing Register 10

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC2_SW10: 0x40005A2A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					vo_abus2	RSVD	vo_abus0

Bits	Name	Description
2	vo_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-368.
0	vo_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-368.

Table 1-368. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.440 SC2_CLK

Switched Capacitor Clock Selection Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC2_CLK: 0x40005A2B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	NA		R/W	R	R	R		
Retention	NA		RET	RET	RET	RET		
Name	RSVD		dyn_cntl_en	bypass_sync	clk_en	mx_clk		

Bits	Name	Description
5	dyn_cntl_en	Enable Dynamic Control (UDB generated clock source drives dynamic control)
		See Table 1-371.
4	bypass_sync	Bypass Synchronization
		See Table 1-369.
3	clk_en	Clock gating control
		See Table 1-370.
2:0	mx_clk[2:0]	Clock Selection
		See Table 1-372.

Table 1-369. Bit field encoding: BYPASS_SYNC_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-370. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-371. Bit field encoding: DYN_CNTL_ENUM

Value	Name	Description
1'b0	DYN_CNTL_DIS	Dynamic Control Disabled
1'b1	DYN_CNTL_EN	Dynamic Control Enabled

Table 1-372. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig

1.3.440   SC2_CLK (continued)

Table 1-372. Bit field encoding: MX_CLK_ENUM

3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.441   SC2_BST

Switched Capacitor Boost Clock Selection Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC2_BST: 0x40005A2C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				bst_clk_en	mx_bst_clk		

Bits	Name	Description
3	bst_clk_en	Clock gating control See Table 1-373.
2:0	mx_bst_clk[2:0]	Clock Selection See Table 1-374.

Table 1-373. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-374. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.442   SC3_SW0

Switched Capacitor Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW0: 0x40005A30

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vin_ag7	vin_ag6	vin_ag5	vin_ag4	vin_ag3	vin_ag2	vin_ag1	vin_ag0

Bits	Name	Description
7	vin_ag7	Connect SC signal input VIN to analog global of same side See Table 1-375.
6	vin_ag6	Connect SC signal input VIN to analog global of same side See Table 1-375.
5	vin_ag5	Connect SC signal input VIN to analog global of same side See Table 1-375.
4	vin_ag4	Connect SC signal input VIN to analog global of same side See Table 1-375.
3	vin_ag3	Connect SC signal input VIN to analog global of same side See Table 1-375.
2	vin_ag2	Connect SC signal input VIN to analog global of same side See Table 1-375.
1	vin_ag1	Connect SC signal input VIN to analog global of same side See Table 1-375.
0	vin_ag0	Connect SC signal input VIN to analog global of same side See Table 1-375.

Table 1-375. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.443 SC3_SW2

Switched Capacitor Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW2: 0x40005A32

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	NA:0
HW Access	NA				R	R	R	NA
Retention	NA				RET	RET	RET	NA
Name	RSVD				vin_abus3	vin_abus2	vin_abus1	RSVD

Bits	Name	Description
3	vin_abus3	Connect SC signal input VIN to analog (local) bus of the same side
		See Table 1-376.
2	vin_abus2	Connect SC signal input VIN to analog (local) bus of the same side
		See Table 1-376.
1	vin_abus1	Connect SC signal input VIN to analog (local) bus of the same side
		See Table 1-376.

Table 1-376. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.444   SC3_SW3

Switched Capacitor Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW3: 0x40005A33

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	NA:000			R/W:0	R/W:0
HW Access	NA		R	NA			R	R
Retention	NA		RET	NA			RET	RET
Name	RSVD		vref_bgvref	RSVD			vin_bgvref	vin_amx

Bits	Name	Description
5	vref_bgvref	Connect SC signal input VREF to Bandgap Voltage Reference
		See Table 1-378.
1	vin_bgvref	Connect SC signal input VIN to Bandgap Voltage Reference
		See Table 1-378.
0	vin_amx	Connect SC signal input VIN to Analog Mux Bus
		See Table 1-377.

Table 1-377. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-378. Bit field encoding: VREF_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

1.3.445 SC3_SW4

Switched Capacitor Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW4: 0x40005A34

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0
HW Access	R	NA	R	NA	R	NA	R	NA
Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vref_ag7	RSVD	vref_ag5	RSVD	vref_ag3	RSVD	vref_ag1	RSVD

Bits	Name	Description
7	vref_ag7	Connect SC signal input VREF to analog global of same side See Table 1-379.
5	vref_ag5	Connect SC signal input VREF to analog global of same side See Table 1-379.
3	vref_ag3	Connect SC signal input VREF to analog global of same side See Table 1-379.
1	vref_ag1	Connect SC signal input VREF to analog global of same side See Table 1-379.

Table 1-379. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.446 SC3_SW6

Switched Capacitor Analog Routing Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW6: 0x40005A36

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	NA:0
HW Access	NA						R	NA
Retention	NA						RET	NA
Name	RSVD						vref_abus1	RSVD

Bits	Name	Description
1	vref_abus1	Connect SC signal input VREF to analog (local) bus of the same side
		See Table 1-380.

Table 1-380. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.447   SC3_SW7

Switched Capacitor Analog Routing Register 7

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW7: 0x40005A37

Bits	7	6	5	4	3	2	1	0
SW Access:Reset			NA:00000			R/W:0		NA:00
HW Access			NA			R/W		NA
Retention			NA			RET		NA
Name			RSVD			vin_vo		RSVD

Bits	Name	Description
2	vin_vo	Connect SC signal input VIN to VO of opposite SC
		See Table 1-381.

Table 1-381. Bit field encoding: VIN_VO_ENUM

Value	Name	Description
1'b0	VIN_VO_0	not connected
1'b1	VIN_VO_1	Connect VIN to VO of opposite SC

1.3.448   SC3_SW8

Switched Capacitor Analog Routing Register 8

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW8: 0x40005A38

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vo_ag6	RSVD	vo_ag4	RSVD	vo_ag2	RSVD	vo_ag0

Bits	Name	Description
6	vo_ag6	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-382.
4	vo_ag4	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-382.
2	vo_ag2	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-382.
0	vo_ag0	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-382.

Table 1-382. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.449 SC3_SW10

Switched Capacitor Analog Routing Register 10

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_SW10: 0x40005A3A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset			NA:00000			R/W:0	NA:0	R/W:0
HW Access			NA			R	NA	R
Retention			NA			RET	NA	RET
Name			RSVD			vo_abus2	RSVD	vo_abus0

Bits	Name	Description
2	vo_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-383.
0	vo_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-383.

Table 1-383. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.450   SC3_CLK

Switched Capacitor Clock Selection Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_CLK: 0x40005A3B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	R/W:0	R/W:000		
HW Access	NA		R/W	R	R	R		
Retention	NA		RET	RET	RET	RET		
Name	RSVD		dyn_cntl_en	bypass_sync	clk_en	mx_clk		

Bits	Name	Description
5	dyn_cntl_en	Enable Dynamic Control (UDB generated clock source drives dynamic control)
		See Table 1-386.
4	bypass_sync	Bypass Synchronization
		See Table 1-384.
3	clk_en	Clock gating control
		See Table 1-385.
2:0	mx_clk[2:0]	Clock Selection
		See Table 1-387.

Table 1-384. Bit field encoding: BYPASS_SYNC_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-385. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-386. Bit field encoding: DYN_CNTL_ENUM

Value	Name	Description
1'b0	DYN_CNTL_DIS	Dynamic Control Disabled
1'b1	DYN_CNTL_EN	Dynamic Control Enabled

Table 1-387. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig

1.3.450   SC3_CLK (continued)

Table 1-387. Bit field encoding: MX_CLK_ENUM

3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.451 SC3_BST

Switched Capacitor Boost Clock Selection Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC3_BST: 0x40005A3C

Bits	7	6	5	4	3	2	1	0

HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				bst_clk_en	mx_bst_clk		

Bits	Name	Description
3	bst_clk_en	Clock gating control See Table 1-388.
2:0	mx_bst_clk[2:0]	Clock Selection See Table 1-389.

Table 1-388. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-389. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.452   DAC0_SW0

DAC Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_SW0: 0x40005A80

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						v_ag1	v_ag0

Bits	Name	Description
1	v_ag1	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-390.
0	v_ag0	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-390.

Table 1-390. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.453   DAC0_SW2

DAC Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_SW2: 0x40005A82

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				v_abus3	RSVD	v_abus1	RSVD

Bits	Name	Description
3	v_abus3	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-391.
1	v_abus1	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-391.

Table 1-391. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.454 DAC0_SW3

DAC Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_SW3: 0x40005A83

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad See Table 1-393.
4	i_amx	Connect current output to Analog Mux Bus See Table 1-392.
0	v_amx	Connect voltage output to Analog Mux Bus See Table 1-392.

Table 1-392. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-393. Bit field encoding: IOUT_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

1.3.455 DAC0_SW4

DAC Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_SW4: 0x40005A84

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						i_ag1	i_ag0

Bits	Name	Description
1	i_ag1	Connect current output to analog global of same side (see field instance name)
		See Table 1-394.
0	i_ag0	Connect current output to analog global of same side (see field instance name)
		See Table 1-394.

Table 1-394. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.456 DAC0_STROBE

DAC Strobe Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_STROBE: 0x40005A87

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0)
		See Table 1-396.
2:0	mx_strobe[2:0]	Strobe source selection
		See Table 1-395.

Table 1-395. Bit field encoding: MX_STROBE_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRITE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SRC	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_DIG	Select clk_a3_dig

Table 1-396. Bit field encoding: STROBE_EN_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

1.3.457   DAC1_SW0

DAC Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC1_SW0: 0x40005A88

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						v_ag1	v_ag0

Bits	Name	Description
1	v_ag1	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-397.
0	v_ag0	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-397.

Table 1-397. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.458   DAC1_SW2

DAC Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC1_SW2: 0x40005A8A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				v_abus3	RSVD	v_abus1	RSVD

Bits	Name	Description
3	v_abus3	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-398.
1	v_abus1	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-398.

Table 1-398. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.459   DAC1_SW3

DAC Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC1_SW3: 0x40005A8B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad
		See Table 1-400.
4	i_amx	Connect current output to Analog Mux Bus
		See Table 1-399.
0	v_amx	Connect voltage output to Analog Mux Bus
		See Table 1-399.

Table 1-399. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-400. Bit field encoding: IOUT_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

1.3.460 DAC1_SW4

DAC Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC1_SW4: 0x40005A8C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						i_ag1	i_ag0

Bits	Name	Description
1	i_ag1	Connect current output to analog global of same side (see field instance name)
		See Table 1-401.
0	i_ag0	Connect current output to analog global of same side (see field instance name)
		See Table 1-401.

Table 1-401. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.461   DAC1_STROBE

DAC Strobe Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC1_STROBE: 0x40005A8F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0) See Table 1-403.
2:0	mx_strobe[2:0]	Strobe source selection See Table 1-402.

Table 1-402. Bit field encoding: MX_STROBE_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRITE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SRC	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_DIG	Select clk_a3_dig

Table 1-403. Bit field encoding: STROBE_EN_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

1.3.462   DAC2_SW0

DAC Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC2_SW0: 0x40005A90

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		v_ag5	v_ag4	RSVD			

Bits	Name	Description
5	v_ag5	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-404.
4	v_ag4	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-404.

Table 1-404. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.463   DAC2_SW2

DAC Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC2_SW2: 0x40005A92

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	NA:0	R/W:0
HW Access	NA					R	NA	R
Retention	NA					RET	NA	RET
Name	RSVD					v_abus2	RSVD	v_abus0

Bits	Name	Description
2	v_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-405.
0	v_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-405.

Table 1-405. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.464   DAC2_SW3

DAC Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC2_SW3: 0x40005A93

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad See Table 1-407.
4	i_amx	Connect current output to Analog Mux Bus See Table 1-406.
0	v_amx	Connect voltage output to Analog Mux Bus See Table 1-406.

Table 1-406. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-407. Bit field encoding: IOUT_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

1.3.465   DAC2_SW4

DAC Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC2_SW4: 0x40005A94

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		i_ag5	i_ag4	RSVD			

Bits	Name	Description
5	i_ag5	Connect current output to analog global of same side (see field instance name)
		See Table 1-408.
4	i_ag4	Connect current output to analog global of same side (see field instance name)
		See Table 1-408.

Table 1-408. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.466   DAC2_STROBE

DAC Strobe Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC2_STROBE: 0x40005A97

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0)
		See Table 1-410.
2:0	mx_strobe[2:0]	Strobe source selection
		See Table 1-409.

Table 1-409. Bit field encoding: MX_STROBE_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRITE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SRC	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_DIG	Select clk_a3_dig

Table 1-410. Bit field encoding: STROBE_EN_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

1.3.467   DAC3_SW0

DAC Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC3_SW0: 0x40005A98

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		v_ag5	v_ag4	RSVD			

Bits	Name	Description
5	v_ag5	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-411.
4	v_ag4	Connect voltage output to analog global of same side (see field instance name)
		See Table 1-411.

Table 1-411. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.468　DAC3_SW2

DAC Analog Routing Register 2

Reset:　　　　System reset for retention flops [reset_all_retention]

Register : Address

DAC3_SW2: 0x40005A9A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset			NA:00000			R/W:0	NA:0	R/W:0
HW Access			NA			R	NA	R
Retention			NA			RET	NA	RET
Name			RSVD			v_abus2	RSVD	v_abus0

Bits	Name	Description
2	v_abus2	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-412.
0	v_abus0	Connect voltage output to analog (local) bus of the same side (see field instance name)
		See Table 1-412.

Table 1-412. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.469   DAC3_SW3

DAC Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC3_SW3: 0x40005A9B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:00		R/W:0	NA:000			R/W:0
HW Access	R	NA		R	NA			R
Retention	RET	NA		RET	NA			RET
Name	iout	RSVD		i_amx	RSVD			v_amx

Bits	Name	Description
7	iout	Connect current output to pad
		See Table 1-414.
4	i_amx	Connect current output to Analog Mux Bus
		See Table 1-413.
0	v_amx	Connect voltage output to Analog Mux Bus
		See Table 1-413.

Table 1-413. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-414. Bit field encoding: IOUT_ENUM

Value	Name	Description
1'b0	IOUT_NC	not connected
1'b1	IOUT_CONNECT	Connect to pad (see routing diagram)

1.3.470   DAC3_SW4

DAC Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC3_SW4: 0x40005A9C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:0000			
HW Access	NA		R	R	NA			
Retention	NA		RET	RET	NA			
Name	RSVD		i_ag5	i_ag4	RSVD			

Bits	Name	Description
5	i_ag5	Connect current output to analog global of same side (see field instance name)
		See Table 1-415.
4	i_ag4	Connect current output to analog global of same side (see field instance name)
		See Table 1-415.

Table 1-415. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.471 DAC3_STROBE

DAC Strobe Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC3_STROBE: 0x40005A9F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:000		
HW Access	NA				R	R		
Retention	NA				RET	RET		
Name	RSVD				strobe_en	mx_strobe		

Bits	Name	Description
3	strobe_en	Strobe gating control (See mx_strobe==3'h0)
		See Table 1-417.
2:0	mx_strobe[2:0]	Strobe source selection
		See Table 1-416.

Table 1-416. Bit field encoding: MX_STROBE_ENUM

Value	Name	Description
3'h0	MX_STROBE_BUSWRITE	Select bus write strobe source (Enable gater regardless of strobe_en setting)
3'h1	MX_STROBE_UDB_SRC	Select UDB strobe source
3'h2	MX_STROBE_NC_2	NC
3'h3	MX_STROBE_NC_3	NC
3'h4	MX_STROBE_CLK_A0_DIG	Select clk_a0_dig
3'h5	MX_STROBE_CLK_A1_DIG	Select clk_a1_dig
3'h6	MX_STROBE_CLK_A2_DIG	Select clk_a2_dig
3'h7	MX_STROBE_CLK_A3_DIG	Select clk_a3_dig

Table 1-417. Bit field encoding: STROBE_EN_ENUM

Value	Name	Description
1'b0	STROBE_EN_0	disable strobe
1'b1	STROBE_EN_1	enable strobe

1.3.472   CMP0_SW0

Comparator Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_SW0: 0x40005AC0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-418.

Table 1-418. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.473   CMP0_SW2

Comparator Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_SW2: 0x40005AC2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-419.
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-419.

Table 1-419. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.474   CMP0_SW3

Comparator Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_SW3: 0x40005AC3

Bits	7	6	5	4	3	2	1	0

Bits	Name	Description
6	vn_ag6	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-423.
4	vn_ag4	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-423.
2	vn_ag2	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-423.
0	vn_ag0	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-423.

Table 1-423. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.476   CMP0_SW6

Comparator Analog Routing Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_SW6: 0x40005AC6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-424.
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-424.

Table 1-424. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.477 CMP0_CLK

Comparator Clock Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP0_CLK: 0x40005AC7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization See Table 1-425.
3	clk_en	Clock gating control See Table 1-426.
2:0	mx_clk[2:0]	Clock Selection See Table 1-427.

Table 1-425. Bit field encoding: BYPASS_SYNC_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-426. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-427. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.478 CMP1_SW0

Comparator Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name) See Table 1-429.
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) See Table 1-429.

Table 1-429. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.480   CMP1_SW3

Comparator Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP1_SW3: 0x40005ACB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:00		R/W:0
HW Access	NA	R	R	R	R	NA		R
Retention	NA	RET	RET	RET	RET	NA		RET
Name	RSVD	vn_vref1	vn_vref0	vn_amx	vp_refbuf	RSVD		vp_amx

Bits	Name	Description
6	vn_vref1	Connect negative voltage input to Voltage Reference 0 See Table 1-432.
5	vn_vref0	Connect negative voltage input to Voltage Reference 1 See Table 1-432.
4	vn_amx	Connect negative voltage input to Analog Mux Bus See Table 1-430.
3	vp_refbuf	Connect positive voltage input to CapSense reference buffer channel See Table 1-431.
0	vp_amx	Connect positive voltage input to Analog Mux Bus See Table 1-430.

Table 1-430. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-431. Bit field encoding: VP_REFBUF_ENUM

Value	Name	Description
1'b0	VP_REFBUF_ENABLED	disable
1'b1	VP_REFBUF_DISABLED	enable

Table 1-432. Bit field encoding: VREF_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

1.3.481   CMP1_SW4

Comparator Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP1_SW4: 0x40005ACC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0
HW Access	NA	R	NA	R	NA	R	NA	R
Retention	NA	RET	NA	RET	NA	RET	NA	RET
Name	RSVD	vn_ag6	RSVD	vn_ag4	RSVD	vn_ag2	RSVD	vn_ag0

Bits	Name	Description
6	vn_ag6	Connect negative voltage input to analog global of same side (see field instance name)
		See Table 1-433.
4	vn_ag4	Connect negative voltage input to analog global of same side (see field instance name)
		See Table 1-433.
2	vn_ag2	Connect negative voltage input to analog global of same side (see field instance name)
		See Table 1-433.
0	vn_ag0	Connect negative voltage input to analog global of same side (see field instance name)
		See Table 1-433.

Table 1-433. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.482   CMP1_SW6

Comparator Analog Routing Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP1_SW6: 0x40005ACE

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-434.
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-434.

Table 1-434. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.483   CMP1_CLK

Comparator Clock Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP1_CLK: 0x40005ACF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization See Table 1-435.
3	clk_en	Clock gating control See Table 1-436.
2:0	mx_clk[2:0]	Clock Selection See Table 1-437.

Table 1-435. Bit field encoding: BYPASS_SYNC_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-436. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-437. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.484   CMP2_SW0

Comparator Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP2_SW0: 0x40005AD0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-438.

Table 1-438. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.485   CMP2_SW2

Comparator Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP2_SW2: 0x40005AD2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						vp_abus1	vp_abus0

Bits	Name	Description
1	vp_abus1	Connect positive voltage input to analog (local) bus of the same side (see field instance name) See Table 1-439.
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name) See Table 1-439.

Table 1-439. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.486   CMP2_SW3

Comparator Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP2_SW3: 0x40005AD3

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	NA:00		R/W:0
HW Access	NA	R	R	R	R	NA		R
Retention	NA	RET	RET	RET	RET	NA		RET
Name	RSVD	vn_vref1	vn_vref0	vn_amx	vp_refbuf	RSVD		vp_amx

Bits	Name	Description
6	vn_vref1	Connect negative voltage input to Voltage Reference 0
		See Table 1-442.
5	vn_vref0	Connect negative voltage input to Voltage Reference 1
		See Table 1-442.
4	vn_amx	Connect negative voltage input to Analog Mux Bus
		See Table 1-440.
3	vp_refbuf	Connect positive voltage input to CapSense reference buffer channel
		See Table 1-441.
0	vp_amx	Connect positive voltage input to Analog Mux Bus
		See Table 1-440.

Table 1-440. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-441. Bit field encoding: VP_REFBUF_ENUM

Value	Name	Description
1'b0	VP_REFBUF_ENABLED	disable
1'b1	VP_REFBUF_DISABLED	enable

Table 1-442. Bit field encoding: VREF_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

1.3.487 CMP2_SW4

Comparator Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP2_SW4: 0x40005AD4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0	R/W:0	NA:0

Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vn_ag7	RSVD	vn_ag5	RSVD	vn_ag3	RSVD	vn_ag1	RSVD

Bits	Name	Description
7	vn_ag7	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-443.
5	vn_ag5	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-443.
3	vn_ag3	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-443.
1	vn_ag1	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-443.

Table 1-443. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.488 CMP2_SW6

Comparator Analog Routing Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP2_SW6: 0x40005AD6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	NA:00	
HW Access	NA				R	R	NA	
Retention	NA				RET	RET	NA	
Name	RSVD				vn_abus3	vn_abus2	RSVD	

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-444.
2	vn_abus2	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-444.

Table 1-444. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.489   CMP2_CLK

Comparator Clock Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP2_CLK: 0x40005AD7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization See Table 1-445.
3	clk_en	Clock gating control See Table 1-446.
2:0	mx_clk[2:0]	Clock Selection See Table 1-447.

Table 1-445. Bit field encoding: BYPASS_SYNC_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-446. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-447. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.490   CMP3_SW0

Comparator Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP3_SW0: 0x40005AD8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0

		See Table 1-459.
0	vp_abus0	Connect positive voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-459.

Table 1-459. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.498 DSM0_SW3

Delta Sigma Modulator Analog Routing Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DSM0_SW3: 0x40005B03

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	NA:00		R/W:0	NA:0	R/W:0
HW Access	NA	R	R	NA		R	NA	R
Retention	NA	RET	RET	NA		RET	NA	RET
Name	RSVD	vn_vssa	vn_vref	RSVD		vp_vssa	RSVD	vp_amx

Bits	Name	Description
6	vn_vssa	Connect negative voltage input to vssa
		See Table 1-462.
5	vn_vref	Connect negative voltage input to Voltage Reference
		See Table 1-461.
2	vp_vssa	Connect positive voltage input to vssa
		See Table 1-462.
0	vp_amx	Connect positive voltage input to Analog Mux Bus
		See Table 1-460.

Table 1-460. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	not connected
1'b1	AMX_CONNECTED	Connect to AMUXBUS

Table 1-461. Bit field encoding: VREF_ENUM

Value	Name	Description
1'b0	VREF_NC	not connected
1'b1	VREF_CONNECTED	Connect to Voltage Reference

Table 1-462. Bit field encoding: VSSA_ENUM

Value	Name	Description
1'b0	VSSA_NC	not connected
1'b1	VSSA_CONNECTED	Connect to vssa

1.3.499   DSM0_SW4

Delta Sigma Modulator Analog Routing Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DSM0_SW4: 0x40005B04

Bits	7	6	5	4	3	2	1	0

Retention	RET	NA	RET	NA	RET	NA	RET	NA
Name	vn_ag7	RSVD	vn_ag5	RSVD	vn_ag3	RSVD	vn_ag1	RSVD

Bits	Name	Description
7	vn_ag7	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-463.
5	vn_ag5	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-463.
3	vn_ag3	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-463.
1	vn_ag1	Connect negative voltage input to analog global of same side (see field instance name) See Table 1-463.

Table 1-463. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.500   DSM0_SW6

Delta Sigma Modulator Analog Routing Register 6

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

DSM0_SW6: 0x40005B06

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	NA:0	R/W:0	NA:0
HW Access	NA				R	NA	R	NA
Retention	NA				RET	NA	RET	NA
Name	RSVD				vn_abus3	RSVD	vn_abus1	RSVD

Bits	Name	Description
3	vn_abus3	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-464.
1	vn_abus1	Connect negative voltage input to analog (local) bus of the same side (see field instance name)
		See Table 1-464.

Table 1-464. Bit field encoding: ABUS_ENUM

Value	Name	Description
1'b0	ABUS_NC	not connected
1'b1	ABUS_CONNECTED	Connect to Analog (local) Bus

1.3.501   DSM0_CLK

Delta Sigma Modulator Clock Selection Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DSM0_CLK: 0x40005B07

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:000		
HW Access	NA			R	R	R		
Retention	NA			RET	RET	RET		
Name	RSVD			bypass_sync	clk_en	mx_clk		

Bits	Name	Description
4	bypass_sync	Bypass Synchronization See Table 1-465.
3	clk_en	Clock gating control See Table 1-466.
2:0	mx_clk[2:0]	Clock Selection See Table 1-467.

Table 1-465. Bit field encoding: BYPASS_SYNC_ENUM

Value	Name	Description
1'b0	BYPASS_SYNC_0	Synchronization not bypassed (Synchronization enabled)
1'b1	BYPASS_SYNC_1	Synchronization bypassed (Synchronization disabled)

Table 1-466. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	CLK_EN_0	disable clock
1'b1	CLK_EN_1	enable clock

Table 1-467. Bit field encoding: MX_CLK_ENUM

Value	Name	Description
3'h0	MX_CLK_0	Select clk_a0 and clk_a0_dig
3'h1	MX_CLK_1	Select clk_a1 and clk_a1_dig
3'h2	MX_CLK_2	Select clk_a2 and clk_a2_dig
3'h3	MX_CLK_3	Select clk_a3 and clk_a3_dig
3'h4	MX_CLK_4	Select UDB generated clock. Per IROS - System timing with the UDB generated clock is not supported by default and should involve engineering to use
3'h5	MX_CLK_5	Reserved
3'h6	MX_CLK_6	Reserved
3'h7	MX_CLK_7	Reserved

1.3.502   SAR0_SW0

SAR Analog Routing Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SAR0_SW0: 0x40005B20

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	vp_ag7	vp_ag6	vp_ag5	vp_ag4	vp_ag3	vp_ag2	vp_ag1	vp_ag0

Bits	Name	Description
7	vp_ag7	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
6	vp_ag6	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
5	vp_ag5	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
4	vp_ag4	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
3	vp_ag3	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
2	vp_ag2	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
1	vp_ag1	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.
0	vp_ag0	Connect positive voltage input to analog global of same side (see field instance name) See Table 1-468.

Table 1-468. Bit field encoding: AG_ENUM

Value	Name	Description
1'b0	AG_NC	not connected
1'b1	AG_CONNECTED	Connect to Analog Global

1.3.503   SAR0_SW2

SAR Analog Routing Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SAR0_SW2: 0x40005B22

HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					swinp	swinn	swfol

Bits	Name	Description
2	swinp	Switch Enable Positive Input
1	swinn	Switch Enable Negative Input
0	swfol	Switch Enable Follow

1.3.522 LCDDAC_SW0

LCDDAC Switch Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_SW0: 0x40005B50

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw0		

Bits	Name	Description
2:0	sw0[2:0]	Switch Control for LCD_BIAS_BUS[0]
		See Table 1-498.

Table 1-498. Bit field encoding: LCDDAC_SW0_ENUM

Value	Name	Description
3'h0	LCDDAC_SW0_NC	NC
3'h1	LCDDAC_SW0_LCDDAC_V0	LCDDAC_V0 connected to LCD_BIAS_BUS[0]
3'h2	LCDDAC_SW0_ABUSR0	ABUSR[0] connected to LCD_BIAS_BUS[0]
3'h3	LCDDAC_SW0_3	LCDDAC_V0 and ABUSR[0] connected to LCD_BIAS_BUS[0]
3'h4	LCDDAC_SW0_ABUSR1	ABUSR[1] connected to LCD_BIAS_BUS[0]
3'h5	LCDDAC_SW0_5	LCDDAC_V0 and ABUSR[1] connected to LCD_BIAS_BUS[0]
3'h6	LCDDAC_SW0_6	ABUSR[0] and ABUSR[1] connected to LCD_BIAS_BUS[0]
3'h7	LCDDAC_SW0_7	LCDDAC_V0 and ABUSR[0] and ABUSR[1] connected to LCD_BIAS_BUS[0]

1.3.523   LCDDAC_SW1

LCDDAC Switch Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_SW1: 0x40005B51

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw1		

Bits	Name	Description
2:0	sw1[2:0]	Switch Control for LCD_BIAS_BUS[1]
		See Table 1-499.

Table 1-499. Bit field encoding: LCDDAC_SW1_ENUM

Value	Name	Description
3'h0	LCDDAC_SW1_NC	NC
3'h1	LCDDAC_SW1_LCDDAC_V1	LCDDAC_V1 connected to LCD_BIAS_BUS[1]
3'h2	LCDDAC_SW1_ABUSL0	ABUSL[0] connected to LCD_BIAS_BUS[1]
3'h3	LCDDAC_SW1_3	LCDDAC_V1 and ABUSL[0] connected to LCD_BIAS_BUS[1]
3'h4	LCDDAC_SW1_ABUSL1	ABUSL[1] connected to LCD_BIAS_BUS[1]
3'h5	LCDDAC_SW1_5	LCDDAC_V1 and ABUSL[1] connected to LCD_BIAS_BUS[1]
3'h6	LCDDAC_SW1_6	ABUSL[0] and ABUSL[1] connected to LCD_BIAS_BUS[1]
3'h7	LCDDAC_SW1_7	LCDDAC_V1 and ABUSL[0] and ABUSL[1] connected to LCD_BIAS_BUS[1]

1.3.524   LCDDAC_SW2

LCDDAC Switch Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_SW2: 0x40005B52

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw2		

Bits	Name	Description
2:0	sw2[2:0]	Switch Control for LCD_BIAS_BUS[2]
		See Table 1-500.

Table 1-500. Bit field encoding: LCDDAC_SW2_ENUM

Value	Name	Description
3'h0	LCDDAC_SW2_NC	NC
3'h1	LCDDAC_SW2_LCDDAC_V2	LCDDAC_V2 connected to LCD_BIAS_BUS[2]
3'h2	LCDDAC_SW2_ABUSR2	ABUSR[2] connected to LCD_BIAS_BUS[2]
3'h3	LCDDAC_SW2_3	LCDDAC_V2 and ABUSR[2] connected to LCD_BIAS_BUS[2]
3'h4	LCDDAC_SW2_ABUSR3	ABUSR[3] connected to LCD_BIAS_BUS[2]
3'h5	LCDDAC_SW2_5	LCDDAC_V2 and ABUSR[3] connected to LCD_BIAS_BUS[2]
3'h6	LCDDAC_SW2_6	ABUSR[2] and ABUSR[3] connected to LCD_BIAS_BUS[2]
3'h7	LCDDAC_SW2_7	LCDDAC_V2 and ABUSR[2] and ABUSR[3] connected to LCD_BIAS_BUS[2]

1.3.525   LCDDAC_SW3

LCDDAC Switch Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_SW3: 0x40005B53

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw3		

Bits	Name	Description
2:0	sw3[2:0]	Switch Control for LCD_BIAS_BUS[3] See Table 1-501.

Table 1-501. Bit field encoding: LCDDAC_SW3_ENUM

Value	Name	Description
3'h0	LCDDAC_SW3_NC	NC
3'h1	LCDDAC_SW3_LCDDAC_V3	LCDDAC_V3 connected to LCD_BIAS_BUS[3]
3'h2	LCDDAC_SW3_ABUSL2	ABUSL[2] connected to LCD_BIAS_BUS[3]
3'h3	LCDDAC_SW3_3	LCDDAC_V3 and ABUSL[2] connected to LCD_BIAS_BUS[3]
3'h4	LCDDAC_SW3_ABUSL3	ABUSL[3] connected to LCD_BIAS_BUS[3]
3'h5	LCDDAC_SW3_5	LCDDAC_V3 and ABUSL[3] connected to LCD_BIAS_BUS[3]
3'h6	LCDDAC_SW3_6	ABUSL[2] and ABUSL[3] connected to LCD_BIAS_BUS[3]
3'h7	LCDDAC_SW3_7	LCDDAC_V3 and ABUSL[2] and ABUSL[3] connected to LCD_BIAS_BUS[3]

1.3.526   LCDDAC_SW4

LCDDAC Switch Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LCDDAC_SW4: 0x40005B54

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					sw4		

Bits	Name	Description
2:0	sw4[2:0]	Switch Control for LCD_BIAS_BUS[4]
		See Table 1-502.

Table 1-502. Bit field encoding: LCDDAC_SW4_ENUM

Value	Name	Description
3'h0	LCDDAC_SW4_NC	NC
3'h1	LCDDAC_SW4_LCDDAC_V4	LCDDAC_V4 connected to LCD_BIAS_BUS[4]
3'h2	LCDDAC_SW4_AMUXBUSR	AMUXBUSR connected to LCD_BIAS_BUS[4]
3'h3	LCDDAC_SW4_3	LCDDAC_V4 and AMUXBUSR connected to LCD_BIAS_BUS[4]
3'h4	LCDDAC_SW4_AMUXBUSL	AMUXBUSL connected to LCD_BIAS_BUS[4]
3'h5	LCDDAC_SW4_5	LCDDAC_V4 and AMUXBUSL connected to LCD_BIAS_BUS[4]
3'h6	LCDDAC_SW4_6	AMUXBUSR and AMUXBUSL connected to LCD_BIAS_BUS[4]
3'h7	LCDDAC_SW4_7	LCDDAC_V4 and AMUXBUSR and AMUXBUSL connected to LCD_BIAS_BUS[4]

1.3.527   SC_MISC

Switched Cap Miscellaneous Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SC_MISC: 0x40005B56

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	R/W:0	NA:00		R/W:0	R/W:0
HW Access	NA		R	R	NA		R	R
Retention	NA		RET	RET	NA		RET	RET
Name	RSVD		sc_pump_force	sc_pump_auto	RSVD		diff_pga_1_3	diff_pga_0_2

Bits	Name	Description
5	sc_pump_force	force pumping - if block enabled enable pump regardless of voltage state
4	sc_pump_auto	enable autopumping - if block enabled pump when low voltage detected
1	diff_pga_1_3	Switched Cap Pair Connect for Differential Amplifier Applications See Table 1-503.
0	diff_pga_0_2	Switched Cap Pair Connect for Differential Amplifier Applications See Table 1-503.

Table 1-503. Bit field encoding: SC_DIFF_PGA_ENUM

Value	Name	Description
1'h0	SC_DIFF_PGA_DISABLED	Differential PGA pair connect disabled
1'h1	SC_DIFF_PGA_ENABLED	Differential PGA pair connect enabled

1.3.528   BUS_SW0

Bus Switch Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BUS_SW0: 0x40005B58

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	RET	RET	RET	RET	RET	RET	RET	RET
Name	ag7	ag6	ag5	ag4	ag3	ag2	ag1	ag0

Bits	Name	Description
7	ag7	Connect Left and Right Analog Globals See Table 1-511.
6	ag6	Connect Left and Right Analog Globals See Table 1-510.
5	ag5	Connect Left and Right Analog Globals See Table 1-509.
4	ag4	Connect Left and Right Analog Globals See Table 1-508.
3	ag3	Connect Left and Right Analog Globals See Table 1-507.
2	ag2	Connect Left and Right Analog Globals See Table 1-506.
1	ag1	Connect Left and Right Analog Globals See Table 1-505.
0	ag0	Connect Left and Right Analog Globals See Table 1-504.

Table 1-504. Bit field encoding: AG0_ENUM

Value	Name	Description
1'b0	AG0_NC	Disconnect AGL[0] and AGR[0]
1'b1	AG0_CONNECT	Connect AGL[0] and AGR[0]

Table 1-505. Bit field encoding: AG1_ENUM

Value	Name	Description
1'b0	AG1_NC	Disconnect AGL[1] and AGR[1]
1'b1	AG1_CONNECT	Connect AGL[1] and AGR[1]

1.3.528   BUS_SW0 (continued)

Table 1-506. Bit field encoding: AG2_ENUM

Value	Name	Description
1'b0	AG2_NC	Disconnect AGL[2] and AGR[2]
1'b1	AG2_CONNECT	Connect AGL[2] and AGR[2]

Table 1-507. Bit field encoding: AG3_ENUM

Value	Name	Description
1'b0	AG3_NC	Disconnect AGL[3] and AGR[3]
1'b1	AG3_CONNECT	Connect AGL[3] and AGR[3]

Table 1-508. Bit field encoding: AG4_ENUM

Value	Name	Description
1'b0	AG4_NC	Disconnect AGL[4] and AGR[4]
1'b1	AG4_CONNECT	Connect AGL[4] and AGR[4]

Table 1-509. Bit field encoding: AG5_ENUM

Value	Name	Description
1'b0	AG5_NC	Disconnect AGL[5] and AGR[5]
1'b1	AG5_CONNECT	Connect AGL[5] and AGR[5]

Table 1-510. Bit field encoding: AG6_ENUM

Value	Name	Description
1'b0	AG6_NC	Disconnect AGL[6] and AGR[6]
1'b1	AG6_CONNECT	Connect AGL[6] and AGR[6]

Table 1-511. Bit field encoding: AG7_ENUM

Value	Name	Description
1'b0	AG7_NC	Disconnect AGL[7] and AGR[7]
1'b1	AG7_CONNECT	Connect AGL[7] and AGR[7]

1.3.529 BUS_SW2

Bus Switch Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BUS_SW2: 0x40005B5A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				abus3	abus2	abus1	abus0

Bits	Name	Description
3	abus3	Connect Left and Right Analog (local) Buses See Table 1-515.
2	abus2	Connect Left and Right Analog (local) Buses See Table 1-514.
1	abus1	Connect Left and Right Analog (local) Buses See Table 1-513.
0	abus0	Connect Left and Right Analog (local) Buses See Table 1-512.

Table 1-512. Bit field encoding: ABUS0_ENUM

Value	Name	Description
1'b0	ABUS0_NC	Disconnect ABUSL[0] and ABUSR[0]
1'b1	ABUS0_CONNECT	Connect ABUSL[0] and ABUSR[0]

Table 1-513. Bit field encoding: ABUS1_ENUM

Value	Name	Description
1'b0	ABUS1_NC	Disconnect ABUSL[1] and ABUSR[1]
1'b1	ABUS1_CONNECT	Connect ABUSL[1] and ABUSR[1]

Table 1-514. Bit field encoding: ABUS2_ENUM

Value	Name	Description
1'b0	ABUS2_NC	Disconnect ABUSL[2] and ABUSR[2]
1'b1	ABUS2_CONNECT	Connect ABUSL[2] and ABUSR[2]

Table 1-515. Bit field encoding: ABUS3_ENUM

Value	Name	Description
1'b0	ABUS3_NC	Disconnect ABUSL[3] and ABUSR[3]
1'b1	ABUS3_CONNECT	Connect ABUSL[3] and ABUSR[3]

1.3.530 BUS_SW3

Bus Switch Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

BUS_SW3: 0x40005B5B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		NA:0	R/W:0
HW Access	NA				R		NA	R
Retention	NA				RET		NA	RET
Name	RSVD				power2ag_sel		RSVD	amx

Bits	Name	Description
3:2	power2ag_sel[1:0]	Connect power pins to Analog Global
		See Table 1-517.
0	amx	Connect Left and Rigth Analog Mux Bus
		See Table 1-516.

Table 1-516. Bit field encoding: AMX_ENUM

Value	Name	Description
1'b0	AMX_NC	Disconnect AMXL and AMXR
1'b1	AMX_CONNECT	Connect AMXL and AMXR

Table 1-517. Bit field encoding: POWER2AG_SEL_ENUM

Value	Name	Description
2'h0	POWER2AG_SEL_NC	AGL[3] not connected to power pins
2'h1	POWER2AG_SEL_VDDA	AGL[3] connected to vdda
2'h2	POWER2AG_SEL_VDDD	AGL[3] connected to vddd
2'h3	POWER2AG_SEL_VBAT	AGL[3] connected to vbat (RC filtered)

1.3.531   DFT_CR0

DFT Control Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFT_CR0: 0x40005B5C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	NA:0	R/W:000		
HW Access	R	R	R	R	NA	R		
Retention	NA	RET	NA	RET	NA	RET		
Name	RSVD2	en_tp2	RSVD1	en_tp1	RSVD	tvmon1_sel		

Bits	Name	Description
7	RSVD2	Reserved
6	en_tp2	enable level shifting from TP2 (test point 2) pad to analog global route AGL1
5	RSVD1	Reserved
4	en_tp1	enable level shifting from TP1 (test point 1) pad to analog global route AGL0
2:0	tvmon1_sel[2:0]	Connect power net to tvmon1 test point (Also need to select tvmon1 for DFT mux input)
		See Table 1-518.

Table 1-518. Bit field encoding: TVMON1_SEL_ENUM

Value	Name	Description
3'h0	TVMON1_SEL_NC	tvmon1/1a test points not connected (Default)
3'h1	TVMON1_SEL_VSLEEP	tvmon1/1a test points connected to vsleep
3'h2	TVMON1_SEL_VPWRKA	tvmon1/1a test points connected to vpwrka
3'h3	TVMON1_SEL_VPWRI2C	tvmon1/1a test points connected to vpwri2c
3'h4	TVMON1_SEL_VPB	tvmon1/1a test points connected to vpb/vccd (vpb is shorted to vccd)
3'h5	TVMON1_SEL_VPWRA	tvmon1/1a test points connected to vpwra
3'h6	TVMON1_SEL_VNWELL	tvmon1/1a test points connected to vnwell
3'h7	TVMON1_SEL_NC2	tvmon1/1a test points not connected

1.3.532   DFT_CR1

DFT Control Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFT_CR1: 0x40005B5D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:000		
HW Access	NA					R		
Retention	NA					RET		
Name	RSVD					tvmon2_sel		

Bits	Name	Description
2:0	tvmon2_sel[2:0]	Connect power net to tvmon2 test point (Also need to select tvmon1 for DFT mux input)
		See Table 1-519.

Table 1-519. Bit field encoding: TVMON2_SEL_ENUM

Value	Name	Description
3'h0	TVMON2_SEL_NC	tvmon2/2a test points not connected (Default)
3'h1	TVMON2_SEL_VNB	tvmon2/2a test points connected to vnb
3'h2	TVMON2_SEL_VREF	tvmon2/2a test points connected to bref_v800mV
3'h3	TVMON2_SEL_VSSD	tvmon2/2a test points connected to vssd
3'h4	TVMON2_SEL_NPROT	tvmon2/2a test points connected to nprot
3'h5	TVMON2_SEL_BIASN	tvmon2/2a test points connected to biasn
3'h6	TVMON2_SEL_VSSA	tvmon2/2a test points connected to vssa
3'h7	TVMON2_SEL_NC2	tvmon2/2a test points not connected

1.3.533   DFT_CR2

DFT Control Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFT_CR2: 0x40005B5E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			NA:0	R/W:000		
HW Access	NA	R			NA	R		
Retention	NA	RET			NA	RET		
Name	RSVD	dft_mx1			RSVD	dft_mx0		

Bits	Name	Description
6:4	dft_mx1[2:0]	Connect test signals to AGL<7> (Analog Global Left 7)
		See Table 1-521.
2:0	dft_mx0[2:0]	Connect test signals to AGL<4> (Analog Global Left 4)
		See Table 1-520.

Table 1-520. Bit field encoding: DFT_MX0_ENUM

Value	Name	Description
3'h0	DFT_MX0_0	HiZ - Not connected (NC)
3'h1	DFT_MX0_DAC0_TMUX_AGL4	Connect dac0_tmux to AGL<4>
3'h2	DFT_MX0_DSM0_SUMN_TST_AGL4	Connect dsm0_sumn_tst to AGL<4>
3'h3	DFT_MX0_DSM0_REFOUT_AGL4	Connect dsm0_refout to AGL<4>
3'h4	DFT_MX0_DSM0_TST_DIGOUT_AGL4	Connect dsm0_tst_digout to AGL<4>
3'h5	DFT_MX0_TS_DFT_AGL4	Connect ts_dft (SPC Temp Sensor) to AGL<4>
3'h6	DFT_MX0_FM_DFT_AGL4	Connect fm_dft (Flash Memory) to AGL<4>
3'h7	DFT_MX0_RSVD	Reserved - HiZ - Not connected (NC)

Table 1-521. Bit field encoding: DFT_MX1_ENUM

Value	Name	Description
3'h0	DFT_MX1_0	HiZ - Not connected (NC)
3'h1	DFT_MX1_DAC2_TMUX_AGL7	Connect dac2_tmux to AGL<7>
3'h2	DFT_MX1_CMP_DFT_AGL7	Connect cmp_dft to AGL<7> (see also cmp_mxdft[1:0])
3'h3	DFT_MX1_TVMON1_AGL7	Connect pwrsys tvmon1 to AGL<7>
3'h4	DFT_MX1_TVMON2_AGL7	Connect pwrsys tvmon2 to AGL<7>
3'h5	DFT_MX1_DSM0_SUMP_TST_AGL7	Connect dsm0_sump_tst to AGL<7>

1.3.533   DFT_CR2 (continued)

Table 1-521. Bit field encoding: DFT_MX1_ENUM

3'h6	DFT_MX1_BREF_ITEST_AGL7	Connect bref_itest to AGL<7>
3'h7	DFT_MX1_RSVD	Reserved - HiZ - Not connected (NC)

1.3.534 DFT_CR3

DFT Control Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFT_CR3: 0x40005B5F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			NA:0	R/W:000		
HW Access	NA	R			NA	R		
Retention	NA	RET			NA	RET		
Name	RSVD	dft_mx3			RSVD	dft_mx2		

Bits	Name	Description
6:4	dft_mx3[2:0]	Connect test signals to AGR<7> (Analog Global Right 7)
		See Table 1-523.
2:0	dft_mx2[2:0]	Connect test signals to AGR<4> (Analog Global Right 4)
		See Table 1-522.

Table 1-522. Bit field encoding: DFT_MX2_ENUM

Value	Name	Description
3'h0	DFT_MX2_0	HiZ - Not connected (NC)
3'h1	DFT_MX2_DAC3_TMUX_AGR4	Connect dacr1_tmux to AGR<4>
3'h2	DFT_MX2_BREF_ISRC7_AGR4	Connect bref_isrc7 to AGR<4>
3'h3	DFT_MX2_3	HiZ - Not connected (NC)
3'h4	DFT_MX2_S8XOSC_TPUMP_DFT_AGR4	Connect s8xosc_tpump_dft to AGR<4>
3'h5	DFT_MX2_TVMON1A_AGR4	Connect pwrsys tvmon1a to AGR<4>
3'h6	DFT_MX2_TVMON2A_AGR4	Connect pwrsys tvmon2a to AGR<4>
3'h7	DFT_MX2_RSVD	Reserved - HiZ - Not connected (NC)

Table 1-523. Bit field encoding: DFT_MX3_ENUM

Value	Name	Description
3'h0	DFT_MX3_0	NC
3'h1	DFT_MX3_DAC1_TMUX_AGR7	Connect dac1_tmux to AGR<7>
3'h2	DFT_MX3_S8XOSC_TESTOUT_DFT_AGR7	Connect s8xosc_testout_dft to AGR<7>
3'h3	DFT_MX3_BGREFS_TMUX_AGR7	Connect bgrefs_tmux to AGR<7>
3'h4	DFT_MX3_BG_TMUX_AGR7	Connect bg_tmux to AGR<7>
3'h5	DFT_MX3_X32_TST_AGR7	Connect x32_tst to AGR<7>

1.3.534   DFT_CR3 (continued)

Table 1-523. Bit field encoding: DFT_MX3_ENUM

3'h6	DFT_MX3_PLL_VCTRLIO_AGR7	Connect pll_VctrlIO to AGR<7>
3'h7	DFT_MX3_RSVD	Reserved - HiZ - Not connected (NC)

1.3.535 DFT_CR4

DFT Control Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFT_CR4: 0x40005B60

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			NA:0	R/W:000		
HW Access	NA	R			NA	R		
Retention	NA	RET			NA	RET		
Name	RSVD	nw_mux_sel			RSVD	ne_mux_sel		

Bits	Name	Description
6:4	nw_mux_sel[2:0]	Northwest IO Ring Corner Power Probe Mux Selection See Table 1-525.
2:0	ne_mux_sel[2:0]	Northeast IO Ring Corner Power Probe Mux Selection See Table 1-524.

Table 1-524. Bit field encoding: NE_MUX_SEL_ENUM

Value	Name	Description
3'h0	NE_MUX_SEL_NC	NC (HiZ)
3'h1	NE_MUX_SEL_1	vpwrao
3'h2	NE_MUX_SEL_2	vnwell
3'h3	NE_MUX_SEL_3	vpwrka
3'h4	NE_MUX_SEL_4	vpwrsleep
3'h5	NE_MUX_SEL_5	vccd
3'h6	NE_MUX_SEL_6	vcd_lcd (South side of power switch)
3'h7	NE_MUX_SEL_7	vccd_io (South side of power switch)

Table 1-525. Bit field encoding: NW_MUX_SEL_ENUM

Value	Name	Description
3'h0	NW_MUX_SEL_NC	NC (HiZ)
3'h1	NW_MUX_SEL_1	vpwrao
3'h2	NW_MUX_SEL_2	vnwell
3'h3	NW_MUX_SEL_3	vpwrka
3'h4	NW_MUX_SEL_4	vccd
3'h5	NW_MUX_SEL_5	vccd_leopard_main_pd (South side of power switch)
3'h6	NW_MUX_SEL_6	vccd
3'h7	NW_MUX_SEL_7	vccd_leopard_clkpm_pd (South side of power switch)

1.3.536 DFT_CR5

DFT Control Register 5

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFT_CR5: 0x40005B61

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			NA:0	R/W:000		
HW Access	NA	R			NA	R		
Retention	NA	RET			NA	RET		
Name	RSVD	sw_mux_sel			RSVD	se_mux_sel		

Bits	Name	Description
6:4	sw_mux_sel[2:0]	Southwest IO Ring Corner Power Probe Mux Selection
		See Table 1-527.
2:0	se_mux_sel[2:0]	Southeast IO Ring Corner Power Probe Mux Selection
		See Table 1-526.

Table 1-526. Bit field encoding: SE_MUX_SEL_ENUM

Value	Name	Description
3'h0	SE_MUX_SEL_NC	NC (HiZ)
3'h1	SE_MUX_SEL_1	vpwrao
3'h2	SE_MUX_SEL_2	vnwell
3'h3	SE_MUX_SEL_3	vpwrka
3'h4	SE_MUX_SEL_4	vpwr_udb (South side of power switch)
3'h5	SE_MUX_SEL_5	vpwr_imo (South side of power switch)
3'h6	SE_MUX_SEL_6	vpwri2c
3'h7	SE_MUX_SEL_7	vbleed_sysmem_0 (South side of power switch)

Table 1-527. Bit field encoding: SW_MUX_SEL_ENUM

Value	Name	Description
3'h0	SW_MUX_SEL_NC	NC (HiZ)
3'h1	SW_MUX_SEL_1	vpwrao
3'h2	SW_MUX_SEL_2	vnwell
3'h3	SW_MUX_SEL_3	vpwrka
3'h4	SW_MUX_SEL_4	vpwr_fm (South side of power switch)
3'h5	SW_MUX_SEL_5	vpwr_nvpump_pos (South side of power switch)
3'h6	SW_MUX_SEL_6	vpwr_ee (South side of power switch)
3'h7	SW_MUX_SEL_7	vpwr_iref (South side of power switch)

1.3.537   DAC[0..3]_D

DAC Data Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DAC0_D: 0x40005B80   DAC1_D: 0x40005B81   DAC2_D: 0x40005B82

DAC3_D: 0x40005B83

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	data							

This register stores the DAC output data. This register is retained during low power modes, however the internal registers inside the DAC are not. To drive out DAC data upon return from low power modes, this register must be rewritten or the DAC must be strobed once.

Bits	Name	Description
7:0	data[7:0]	8 DAC data bits. These bits are retained in low power modes, but internal DAC state is not. To drive DAC data out upon return from lower power modes, this register must be rewritten or a DAC strobe supplied.

1.3.538   DSM[0..0]_OUT0

DSM Output Register 0

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DSM0_OUT0: 0x40005B88

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	dout							

Bits	Name	Description
7:0	dout[7:0]	DSM output

1.3.539 DSM[0..0]_OUT1

DSM Output Register 1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DSM0_OUT1: 0x40005B89

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R:0	R:0	R:0000			
HW Access	NA		W	W	W			
Retention	NA		NONRET	NONRET	NONRET			
Name	RSVD		ovdcause	ovdflag	dout2scomp			

Bits	Name	Description
5	ovdcause	Overload Cause
		See Table 1-529.
4	ovdflag	Overload detected
3:0	dout2scomp[3:0]	DSM Output Register 1
		See Table 1-528.

Table 1-528. Bit field encoding: DSM_DOUT2SCOMP_ENUM

Value	Name	Description
4'h0	DSM_DOUT2SCOMP_0	NA (qlev=00); 0 (qlev=01); 0 (qlev=10)

Table 1-529. Bit field encoding: OVDCAUSE_ENUM

1'b1	OVDCAUSE_1	1s overload

1.3.540 LUT_SR

LUT Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

LUT_SR: 0x40005B90

Bits	7	6	5	4	3	2	1	0
SW Access:Reset		NA:0000			RC:0	RC:0	RC:0	RC:0
HW Access		NA			R/W	R/W	R/W	R/W
Retention		NA			NONRET	NONRET	NONRET	NONRET
Name		RSVD			lut3_out	lut2_out	lut1_out	lut0_out

Clear-on-read sticky status register

Bits	Name	Description
3	lut3_out	LUT output
2	lut2_out	LUT output
1	lut1_out	LUT output
0	lut0_out	LUT output

1.3.541 LUT_WRK1

Reserved

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LUT_WRK1: 0x40005B91

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NA							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	Reserved

1.3.542   LUT_MSK

LUT Interrupt ReQuest (IRQ) Mask Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LUT_MSK: 0x40005B92

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				lut3_msk	lut2_msk	lut1_msk	lut0_msk

Bits	Name	Description
3	lut3_msk	Enable LUT IRQ See Table 1-530.
2	lut2_msk	Enable LUT IRQ See Table 1-530.
1	lut1_msk	Enable LUT IRQ See Table 1-530.
0	lut0_msk	Enable LUT IRQ See Table 1-530.

Table 1-530. Bit field encoding: LUT_MSK_ENUM

Value	Name	Description
1'b1	LUT_MSK_ENABLE	enable LUT IRQ
1'b0	LUT_MSK_DISABLE	disable LUT IRQ

1.3.543 LUT_CLK

LUT CLK Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LUT_CLK: 0x40005B93

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				lut3_en_clk	lut2_en_clk	lut1_en_clk	lut0_en_clk

LUT status clk gater control

Bits	Name	Description
3	lut3_en_clk	LUT status clock gater control
		See Table 1-531.
2	lut2_en_clk	LUT status clock gater control
		See Table 1-531.
1	lut1_en_clk	LUT status clock gater control
		See Table 1-531.
0	lut0_en_clk	LUT status clock gater control
		See Table 1-531.

Table 1-531. Bit field encoding: LUT_EN_CLK_ENUM

Value	Name	Description
1'b0	LUT_EN_CLK_DISABLE	LUT status clock disabled
1'b1	LUT_EN_CLK_ENABLE	LUT status clock enabled (must set this bit for LUT interrupts)

1.3.544 LUT_CPTR

LUT Capture Mode Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

LUT_CPTR: 0x40005B94

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				lut3_capture _mode	lut2_capture _mode	lut1_capture _mode	lut0_capture _mode

LUT status capture mode

Bits	Name	Description
3	lut3_capture_mode	LUT status capture mode See Table 1-532.
2	lut2_capture_mode	LUT status capture mode See Table 1-532.
1	lut1_capture_mode	LUT status capture mode See Table 1-532.
0	lut0_capture_mode	LUT status capture mode See Table 1-532.

Table 1-532. Bit field encoding: LUT_CAPTURE_MODE_ENUM

Value	Name	Description
1'b0	LUT_CAPTURE_MODE _EDGE	LUT status edge capture mode
1'b1	LUT_CAPTURE_MODE _LEVEL	LUT status level capture mode

1.3.545 CMP_WRK

Comparator output working register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

CMP_WRK: 0x40005B96

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R:0	R:0	R:0	R:0
HW Access	NA				W	W	W	W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				cmp3_out	cmp2_out	cmp1_out	cmp0_out

Bits	Name	Description
3	cmp3_out	Comparator Output
2	cmp2_out	Comparator Output
1	cmp1_out	Comparator Output
0	cmp0_out	Comparator Output

1.3.546 CMP_TST

Comparator Test Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

CMP_TST: 0x40005B97

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		NA:0	R/W:0
HW Access	NA				R		NA	R
Retention	NA				RET		NA	RET
Name	RSVD				cmp_mxdft		RSVD	bypass_cmp_mux

Bits	Name	Description
3:2	cmp_mxdft[1:0]	Comparator Test Point selection (Need to further select with DFT muxes)
		See Table 1-534.
0	bypass_cmp_mux	Selects if the input of the comparator or the output gets routed through to the output of the block
		See Table 1-533.

Table 1-533. Bit field encoding: CMP_BYPASS_CMP_MUX_ENUM

Value	Name	Description
1'b0	CMP_BYPASS_CMP_MUX_DISABLE	Selects the output of the comparator
1'b1	CMP_BYPASS_CMP_MUX_ENABLE	Selects the positive input of the comparator

Table 1-534. Bit field encoding: CMP_MXDFT_ENUM

Value	Name	Description
2'h0	CMP_MXDFT_0	cmp0_out_tr
2'h1	CMP_MXDFT_1	cmp1_out_tr
2'h2	CMP_MXDFT_2	cmp2_out_tr
2'h3	CMP_MXDFT_3	cmp3_out_tr

1.3.547   SC_SR

Switched Capacitor Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

SC_SR: 0x40005B98

Retention	NONRET	NA			NONRET			
Name	overrun_det	RSVD			data_out_11_8			

Bits	Name	Description
7	overrun_det	data overrun detection flag (read-to-clear sticky bit) is set when overrun_det_en is set and new data overwrote old data / old data not read (completely)
		See Table 1-538.
3:0	data_out_11_8[3:0]	data_out[11:8]

Table 1-538. Bit field encoding: SAR_OVERRUN_DET_ENUM

Value	Name	Description
1'b0	SAR_OVERRUN_DET_0	no data overrun has occurred
1'b1	SAR_OVERRUN_DET_1	data overrun has occurred - all bytes of the last data_out have not been read when new data was written

1.3.554 ANAIF_WRK_SARS_SOF

SAR Global Start-of-frame register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ANAIF_WRK_SARS_SOF: 0x40005BA8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						RET	RET
Name	RSVD						sof_bit_1	sof_bit_0

PRIOR to setting the SOF bit of a SAR, you must enable the SAR's clock by programming the SAR0_CLK (SAR0) or SAR1_CLK (SAR1) register appropriately; the minimum being to set the clk_en bit to 1'b1. The default upon reset when enabling will be SAR clock source == clk_a[0], with Freq(clk_a[0]) = Freq(cpu_clk); that is, divide by one (1). Optionally, you can divide the SAR's clock frequency by programming the corresponding divider value registers (e.g. {CLKDIST_ACFG0_CFG1:CLKDIST_ACFG0_CFG0} if clk_a[0] is selected).

Bits	Name	Description
1	sof_bit_1	Start-of-Frame (sof) register source; enable conversion; (NOTE: autoclearing upon receipt of eof_sync when sof_mode==edge-sensitive)
		See Table 1-539.
0	sof_bit_0	Start-of-Frame (sof) register source; enable conversion; (NOTE: autoclearing upon receipt of eof_sync when sof_mode==edge-sensitive)
		See Table 1-539.

Table 1-539. Bit field encoding: SAR_SOF_BIT_ENUM

Value	Name	Description
1'b0	SAR_SOF_BIT_0	disable conversion
1'b1	SAR_SOF_BIT_1	Enable conversion

1.3.555 USB_EP0_DR[0..7]

Control End point EP0 Data Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_EP0_DR0: 0x40006000   USB_EP0_DR1: 0x40006001

USB_EP0_DR2: 0x40006002   USB_EP0_DR3: 0x40006003

USB_EP0_DR4: 0x40006004   USB_EP0_DR5: 0x40006005

USB_EP0_DR6: 0x40006006   USB_EP0_DR7: 0x40006007

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_byte							

The Endpoint 0 Data Register (EP0_DR) is used to read and write data to the USB control endpoint. The EP0_DR register has a hardware-locking feature that prevents the CPU write when SETUP is active. The registers are locked as soon as the SETUP token is decoded and remain locked throughout the SETUP transaction and until the EP0_CR register have been read. This is to prevent over-writing new SETUP data before firmware knows it has arrived. All other endpoint data buffers do not have this locking feature. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_byte[7:0]	This register is shared for both transmit and receive. The count in the EP0_CNT register determines the number of bytes received or to be transferred.

1.3.556   USB_CR0

USB control 0 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

USB_CR0: 0x40006008

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0000000						
HW Access	R	R						
Retention	RET	RET						
Name	usb_enable	device_address						

The USB Control Register 0 (CR0) is used to set the PSoC3's USB address and enable the USB system resource. All bits in this register are reset to zero when a USB bus reset interrupt occurs. The IMO frequency should be set to 24MHz before USB is enabled. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	usb_enable	This bit enables the PSoC device to respond to USB traffic. 0 - USB disabled. 1 - USB enabled.
6:0	device_address[6:0]	These bits specify the USB device address to which the SIE will respond. This address must be set by firmware and is specified by the USB Host with a SET ADDRESS command during USB enumeration. This value must be programmed by firmware when assigned during enumeration. It is not set automatically by the hardware.

1.3.557   USB_CR1

USB control 1 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

USB_CR1: 0x40006009

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/WZC:0	R/W:0	R/W:0
HW Access	NA				R	W	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				trim_offset_ msb	bus_activity	enable_lock	reg_enable

The USB Control Register 1 (CR1) is used to configure the internal regulator and the oscillator tuning capability. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
3	trim_offset_msb	This bit is enabled/disabled for using trim bit[7]. 0-enabled. 1-disabled.
2	bus_activity	The Bus Activity bit is a stickybit that detects any non-idle USB event that has occurred on the USB bus. Once set to High by the SIE to indicate the bus activity this bit retains its logical High value until firmware clears it. Writing a '0' to this bit clears it; writing a '1' preserves its value. 0 No activity. 1 Non-idle activity (D+ = Low) was detected since the last time the bit was cleared. Sticky (individual bits)
1	enable_lock	This bit is set to turn on the automatic frequency locking of the internal oscillator to USB traffic. Unless an external clock is being provided this bit should remain set for proper USB operation. 0 Locking disabled. 1 Locking enabled.
0	reg_enable	This bit controls the operation of the internal USB regulator. For applications with PSoC supply voltages in the 5V range this bit is set high to enable the internal regulator. For device supply voltage in the 3.3V range this bit is cleared to connect the transceiver directly to the supply. 0-Pass-through mode. Use for Vdd = 3.3V range. 1- Regulating mode. Use for Vdd = 5V range.

1.3.558   USB_SIE_EP_INT_EN

USB SIE Data Endpoints Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP_INT_EN: 0x4000600A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0

Name	ep8_intr	ep7_intr	ep6_intr	ep5_intr	ep4_intr	ep3_intr	ep2_intr	ep1_intr

SIE Data Endpoint Status Register. This is an Interrupt Status Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_intr	EP8 Interrupt Status. 0: EP8 Interrupt not raised. 1: EP8 Interrupt Present
6	ep7_intr	EP7 Interrupt Status. 0: EP7 Interrupt not raised. 1: EP7 Interrupt Present
5	ep6_intr	EP6 Interrupt Status. 0: EP6 Interrupt not raised. 1: EP6 Interrupt Present
4	ep5_intr	EP5 Interrupt Status. 0: EP5 Interrupt not raised. 1: EP5 Interrupt Present
3	ep4_intr	EP4 Interrupt Status. 0: EP4 Interrupt not raised. 1: EP4 Interrupt Present
2	ep3_intr	EP3 Interrupt Status. 0: EP3 Interrupt not raised. 1: EP3 Interrupt Present
1	ep2_intr	EP2 Interrupt Status. 0: EP2 Interrupt not raised. 1: EP2 Interrupt Present
0	ep1_intr	EP1 Interrupt Status. 0: EP1 Interrupt not raised. 1: EP1 Interrupt Present

1.3.560   USB_SIE_EP1_CNT0

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP1_CNT0: 0x4000600C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

1.3.561   USB_SIE_EP1_CNT1

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP1_CNT1: 0x4000600D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control end-points. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater then the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter.The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

1.3.562 USB_SIE_EP1_CR0

Non-control endpoint's control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP1_CR0: 0x4000600E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

1.3.563   USB_USBIO_CR0

USBIO Control 0 Register

Reset: Reset Signals Listed Below

Register : Address

USB_USBIO_CR0: 0x40006010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	NA:0000				R:U
HW Access	R	R	R	NA				W
Retention	RET	RET	RET	NA				NONRET
Name	ten	tse0	td	RSVD				rd

The USB IO Control Register 0 (USBIO_CR0) is used for manually transmitting on the USB D+ and D- pins or reading the differential receiver. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	ten	USB Transmit Enable. This is used to manually transmit on the D+ and D- pins. Normally this bit should be cleared to allow the internal SIE to drive the pins. The most common reason for manually transmitting is to force a resume state on the bus. 0- Manual Transmission Off (TSE0 and TD have no effect). 1- Manual Transmission Enabled (TSE0 and TD determine the state of the D+ and Dpins).
6	tse0	Transmit Single-Ended Zero. SE0: both D+ and D- low. No effect if TEN=0. 0- Do not force SE0. 1- Force SE0 on D+ and D-.
5	td	Transmit Data. Transmit a USB J or K state on the USB bus. No effect if TEN=0 or TSE0=1. 0- Force USB K state (D+ is low D- is high). 1- Force USB J state (D+ is high D- is low)
0	rd	Received Data. This read only bit gives the state of the USB differential receiver. 0- D+ < D- or D+ = D- = 0.

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	rd
System reset for retention flops [reset_all_retention]	td, tse0, ten

1.3.564   USB_USBIO_CR1

USBIO control 1 Register

Reset: Reset Signals Listed Below

Register : Address

USB_USBIO_CR1: 0x40006012

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:1	NA:00		R/W:0	R:U	R:U
HW Access	NA		R	NA		R	W	W
Retention	NA		RET	NA		RET	NONRET	NONRET
Name	RSVD		iomode	RSVD		usbpuen	dpo	dmo

The USB IO Control Register 1 (USBIO_CR1) is used to manually read or write the D+ and D- pins and to configure internal pull-up resistors on those pins. This register is clocked with AHB (BUS) Clock

Bits	Name	Description
5	iomode	This bit allows the D+ and D- pins to be configured for either USB mode or bit banged modes. If this bit is set the DMI and DPI bits are used to drive the D- and D+ pins. 0- USB Mode. Drive Mode has no effect. 1- Drive Mode DMI and DPI determine state of the D+ and D- pins.
2	usbpuen	This bit controls the connection of the internal 1.5 k pull up resistor on the D+ pin. 0- No effect. 1- Apply internal USB pull-up resistor to D+ pad.
1	dpo	This read only bit gives the state of the D+ pin.
0	dmo	This read only bit gives the state of the D- pin.

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	dmo, dpo
System reset for retention flops [reset_all_retention]	usbpuen, iomode

1.3.565 USB_DYN_RECONFIG

USB Dynamic reconfiguration register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_DYN_RECONFIG: 0x40006014

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:0	R/W:000			R/W:0
HW Access	NA			W	R			R
Retention	NA			NONRET	NONRET			NONRET
Name	RSVD			dyn_reconfig_rdy_sts	dyn_reconfig_epno			dyn_config_en

This regsiter is used for dynamically configuring the data EPs. This register is clocked with AHB Clock

Bits	Name	Description
4	dyn_reconfig_rdy_sts	This bit indicates the ready status for the dynamic reconfiguration, when set to 1 , indicates the block is ready for reconfiguration .
3:1	dyn_reconfig_epno[2:0]	These bits indicates the EP number for which reconfiguration is required when dyn_config_en bit is set to 1.
0	dyn_config_en	This bit is used to enable the dynamic re-configuration for the selected EP. If set to 1 , indicates the reconfiguration required for selected EP.

1.3.566   USB_SOF0

Start Of Frame Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SOF0: 0x40006018

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	frame_number							

The USB Start of Frame Registers (SOF0 and SOF1) provide access to the 11-bit SOF frame number. Start of frame packets are sent from the host every one ms. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	frame_number[7:0]	It has the lower 8 bits [7:0] of the SOF frame number.

1.3.567   USB_SOF1

Start Of Frame Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SOF1: 0x40006019

Bits	7	6	5	4	3	2	1	0

HW Access	NA					R/W		
Retention	NA					NONRET		
Name	RSVD					frame_number		

The USB Start of Frame Registers (SOF0 and SOF1) provide access to the 11-bit SOF frame number. Start of frame packets are sent from the host every one ms. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
2:0	frame_number[2:0]	It has the upper 3 bits [10:8] of the SOF frame number.

1.3.568   USB_SIE_EP2_CNT0

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP2_CNT0: 0x4000601C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

1.3.569   USB_SIE_EP2_CNT1

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP2_CNT1: 0x4000601D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control end-points. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater then the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter.The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

1.3.570 USB_SIE_EP2_CR0

Non-control endpoint's control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP2_CR0: 0x4000601E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

1.3.571 USB_EP0_CR

Endpoint0 control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_EP0_CR: 0x40006028

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WC:0	R/WC:0	R/WC:0	R/WC:0	R/W:0000			
HW Access	W	W	W	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	setup_rcvd	in_rcvd	out_rcvd	acked_txn	mode			

The Endpoint Control Register (EP0_CR) is used to configure endpoint 0. Because both firmware and the SIE are allowed to write to the Endpoint 0 Control and Count registers the SIE provides an interlocking mechanism to prevent accidental over-writing of data. When the SIE writes to these registers they are locked and the processor cannot write to them until after reading the EP0_CR register. Writing to this register clears the upper four bits regardless of the value written. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	setup_rcvd	When set this bit indicates a valid SETUP packet was received and ACKed. This bit is forced HIGH from the start of the data packet phase of the SETUP transaction until the start of the ACK packet returned by the SIE. The CPU is prevented from clearing this bit during this interval. After this interval the bit will remain set until cleared by firmware. While this bit is set to '1' the CPU cannot write to the EP0_DRx registers. This prevents firmware from overwriting an incoming SETUP transaction before firmware has a chance to read the SETUP data. This bit is cleared by any non-locked writes to the register. Sticky (individual bits)
6	in_rcvd	When set this bit indicates a valid IN packet has been received. This bit is updated to '1' after the host acknowledges an IN data packet. When clear this bit indicates either no IN has been received or that the host did not acknowledge the IN data by sending ACK handshake. It is cleared by any non-locked writes to the register. Sticky (individual bits)
5	out_rcvd	When set this bit indicates a valid OUT packet has been received and ACKed. This bit is updated to '1' after the last received packet in an OUT transaction. When clear this bit indicates no OUT received. It is cleared by any non-locked writes to the register. Sticky (individual bits)
4	acked_txn	This bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with a ACK packet. This bit is cleared by any nonlocked writes to the register. Sticky (individual bits)
3:0	mode[3:0]	The mode bits control how the USB SIE responds to traffic and how the USB SIE will change the mode of that endpoint as a result of host packets to the endpoint.

1.3.572   USB_EP0_CNT

Endpoint0 count Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_EP0_CNT: 0x40006029

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:00		R/W:0000			
HW Access	R/W	W	NA		R/W			
Retention	NONRET	NONRET	NA		NONRET			
Name	data_toggle	data_valid	RSVD		byte_count			

The Endpoint 0 Count Register (EP0_CNT) is used to configure endpoint 0. Whenever the count updates from a SETUP or OUT transaction this register locks and can not be written by the CPU. Reading the EP0_CR register unlocks this register. This prevents firmware from overwriting a status update on incoming SETUP or OUT transactions before firmware has a chance to read the data. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit. For OUT or SETUP transactions the SIE hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit indicates whether there were errors in OUT or SETUP transactions. It is cleared to '0' if CRC bit stuff or PID errors have occurred. This bit does not update for some endpoint mode settings. This bit may be cleared by writing a zero to it when the register is not locked. 0- Error in data received. 1- No Errors Sticky (individual bits)
3:0	byte_count[3:0]	These bits indicate the number of data bytes in a transaction. For IN transactions firmware loads the count with the number of bytes to be transmitted to the host from the endpoint FIFO. Valid values are 0 to 8. For OUT or SETUP transactions the count is updated by hardware to the number of data bytes received plus two for the CRC bytes. Valid values are 2 to 10.

1.3.573   USB_SIE_EP3_CNT0

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP3_CNT0: 0x4000602C

Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

1.3.583 USB_SIE_EP6_CNT1

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP6_CNT1: 0x4000605D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset				R/W:00000000				
HW Access				R/W				
Retention				NONRET				
Name				data_count				

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control end-points. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater then the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter.The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

1.3.584   USB_SIE_EP6_CR0

Non-control endpoint's control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP6_CR0: 0x4000605E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

1.3.585   USB_SIE_EP7_CNT0

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP7_CNT0: 0x4000606C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

1.3.586 USB_SIE_EP7_CNT1

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP7_CNT1: 0x4000606D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control end-points. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater then the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter.The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

1.3.587   USB_SIE_EP7_CR0

Non-control endpoint's control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP7_CR0: 0x4000606E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

1.3.588   USB_SIE_EP8_CNT0

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP8_CNT0: 0x4000607C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WZC:0	NA:000			R/W:000		
HW Access	R/W	W	NA			R/W		
Retention	NONRET	NONRET	NA			NONRET		
Name	data_toggle	data_valid	RSVD			data_count_msb		

The Endpoint Count Register 0 (CNT0) is used for configuring endpoints one through eight. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	data_toggle	This bit selects the DATA packet's toggle state. For IN transactions firmware must set this bit to the expected state. For OUT transactions the hardware sets this bit to the state of the received Data Toggle bit. 0- DATA0. 1- DATA1
6	data_valid	This bit is used for OUT transactions only and is read only. It is cleared to '0' if CRC bit stuffing errors or PID errors occur. This bit does not update for some endpoint mode settings. 0- Error in data received. 1- No Errors Sticky (individual bits)
2:0	data_count_msb[2:0]	These bits are the 3 MSb bits of a 11-bit counter. The LSb are the Data Count[7:0] bits of the CNT1 register. Refer to the CNT1 register for more information.

1.3.589 USB_SIE_EP8_CNT1

Non-control endpoint count register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP8_CNT1: 0x4000607D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_count							

The Endpoint Count Register 1 (CNT1) sets or reports the number of bytes in a USB data transfer to the non-control end-points. For IN transactions firmware loads the count with the number of data bytes to transmit to the host. Valid values for MODE 1 and MODE 2 are 0 to 514 and for MODE 3 it is 0 to 1025. The 11-bit count also sets the limit for the number of bytes that are received for an OUT transaction. Before an OUT transaction is received for an endpoint set this count value to the maximum number of allowable data bytes. If this count value is set to a value greater then the number of bytes (Data + CRC) received both the data from the USB packet and the 2-byte CRC are written to the USB's dedicated SRAM. If the number of Data Bytes received is exactly same as the 11-bit count then only the Data is updated into the USB SRAM and the CRC is discarded but the OUT transaction is completed according to the Modebits of the EP Control Register. If the number of Data Bytes received is more than the 11-bit count then the OUT transaction is ignored. Once the OUT transaction is complete the full 11-bit count is updated by the SIE to the actual number of data bytes received by the SIE plus two for the packet's CRC. Valid values for MODE 1 and MODE 2 are 2 to 514 and for MODE 3 it is 2 to 1025. To get the actual number of bytes received firmware needs to decrement the 11-bit count by two. This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7:0	data_count[7:0]	These bits are the 8 LSb of a 11-bit counter.The 3 MSb bits are the Count MSbbit of the CNT0 register. The 11-bit count indicates the number of data bytes in a transaction.

1.3.590 USB_SIE_EP8_CR0

Non-control endpoint's control Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_SIE_EP8_CR0: 0x4000607E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/WC:0	R/W:0	R/WC:0	R/W:0000			
HW Access	R	W	R	W	R/W			
Retention	NONRET	NONRET	NONRET	NONRET	NONRET			
Name	stall	err_in_txn	nak_int_en	acked_txn	mode			

The Endpoint Control Register 0 (CR0) is used for status and configuration of the non-control endpoints . This register is clocked with 48 MHz USB Clock

Bits	Name	Description
7	stall	When this bit is set the SIE stalls an OUT packet if the Mode bits are set to ACK-OUT. The SIE stalls an IN packet if the mode bits are set to ACK-IN. This bit must be clear for all other modes. 0- Do not issue a stall. 1- Stall an OUT packet if mode bits are set to ACK-OUT or Stall an IN packet if mode bits are set to ACK-IN.
6	err_in_txn	The Error in transaction bit is set whenever an error is detected. For an IN transaction, this indicates a no response from HOST scenario. For an OUT transaction, this represents an RxErr (PID error/ CRC error/ bit-stuff error scenario). This bit is cleared by any writes to the register. 0- No errored transactions since bit was last cleared. 1- Indicates a transaction ended with an error. Sticky (individual bits)
5	nak_int_en	When set this bit causes an endpoint interrupt to be generated even when a transfer completes with a NAK. 0- Do not issue an interrupt after completing the transaction by sending NAK. 1-Interrupt after transaction is complete by sending NAK.
4	acked_txn	The ACK'd transaction bit is set whenever the SIE engages in a transaction to the register's endpoint that completes with an ACK packet. This bit is cleared by any writes to the register. 0- No ACK'd transactions since bit was last cleared. 1- Indicates a transaction ended with an ACK. Sticky (individual bits)
3:0	mode[3:0]	The mode controls how the USB SIE responds to traffic and how the USB SIE changes the mode of that endpoint as a result of host packets to the endpoint.

1.3.591 USB_ARB_EP1_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP1_CFG: 0x40006080

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.592   USB_ARB_EP1_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP1_INT_EN: 0x40006081

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0

Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.594   USB_ARB_RW1_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW1_WA: 0x40006084

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.595   USB_ARB_RW1_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW1_WA_MSB: 0x40006085

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.596   USB_ARB_RW1_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW1_RA: 0x40006086

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.597 USB_ARB_RW1_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW1_RA_MSB: 0x40006087

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.598　USB_ARB_RW1_DR

Endpoint Data Register

Reset:　　　N/A

Register : Address

USB_ARB_RW1_DR: 0x40006088

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.599   USB_BUF_SIZE

Dedicated Endpoint Buffer Size Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_BUF_SIZE: 0x4000608C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0000				R/W:0000			
HW Access	R				R			
Retention	NONRET				NONRET			
Name	out_buf				in_buf			

Dedicated buffer size for IN and OUT type Endpoints; Encoded power of 2 value; Eg: 1 => 2 bytes; 2 => 4 bytes; 9 => 512 bytes This register is clocked with AHB Bus Clock

Bits	Name	Description
7:4	out_buf[3:0]	Buffer size for OUT Endpoints.
3:0	in_buf[3:0]	Buffer size for IN Endpoints.

1.3.600   USB_EP_ACTIVE

Endpoint Active Indication Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_EP_ACTIVE: 0x4000608E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_act	ep7_act	ep6_act	ep5_act	ep4_act	ep3_act	ep2_act	ep1_act

Endpoint Active Register; Indicates if an Endpoint is active or not; Required to be programmed only in the case of Automatic Memory Management mode of operation. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_act	Endpoint 8 Active Indication. 0: Inactive. 1: Active
6	ep7_act	Endpoint 7 Active Indication. 0: Inactive. 1: Active
5	ep6_act	Endpoint 6 Active Indication. 0: Inactive. 1: Active
4	ep5_act	Endpoint 5 Active Indication. 0: Inactive. 1: Active
3	ep4_act	Endpoint 4 Active Indication. 0: Inactive. 1: Active
2	ep3_act	Endpoint 3 Active Indication. 0: Inactive. 1: Active
1	ep2_act	Endpoint 2 Active Indication. 0: Inactive. 1: Active
0	ep1_act	Endpoint 1 Active Indication. 0: Inactive. 1: Active

1.3.601   USB_EP_TYPE

Endpoint Type (IN/OUT) Indication

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_EP_TYPE: 0x4000608F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_typ	ep7_typ	ep6_typ	ep5_typ	ep4_typ	ep3_typ	ep2_typ	ep1_typ

Endpoint Type Register; Indicates the Endpoint Type as IN / OUT. Value is valid if EP_ACTIVE bit is set for the corresponding Endpoint. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_typ	Endpoint 8 Type Indication. 0: IN. 1: OUT
6	ep7_typ	Endpoint 7 Type Indication. 0: IN. 1: OUT
5	ep6_typ	Endpoint 6 Type Indication. 0: IN. 1: OUT
4	ep5_typ	Endpoint 5 Type Indication. 0: IN. 1: OUT
3	ep4_typ	Endpoint 4 Type Indication. 0: IN. 1: OUT
2	ep3_typ	Endpoint 3 Type Indication. 0: IN. 1: OUT
1	ep2_typ	Endpoint 2 Type Indication. 0: IN. 1: OUT
0	ep1_typ	Endpoint 1 Type Indication. 0: IN. 1: OUT

1.3.602 USB_ARB_EP2_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP2_CFG: 0x40006090

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.603 USB_ARB_EP2_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP2_INT_EN: 0x40006091

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

1.3.604   USB_ARB_EP2_SR

Endpoint Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP2_SR: 0x40006092

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.605 USB_ARB_RW2_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW2_WA: 0x40006094

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.606   USB_ARB_RW2_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW2_WA_MSB: 0x40006095

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.607   USB_ARB_RW2_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW2_RA: 0x40006096

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.608 USB_ARB_RW2_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW2_RA_MSB: 0x40006097

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.609   USB_ARB_RW2_DR

Endpoint Data Register

Reset: N/A

Register : Address

USB_ARB_RW2_DR: 0x40006098

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.610 USB_ARB_CFG

Arbiter Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_CFG: 0x4000609C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:00		R/W:0	NA:0000			
HW Access	R	R		R	NA			
Retention	NONRET	NONRET		NONRET	NA			
Name	cfg_cmp	dma_cfg		auto_mem	RSVD			

Arbiter Configuration Register. For MODE I Operation: This register can be left in its default state. For MODE II and MODE III Operation: This register should be programmed. Cfg_cmp bit set to 0 during configuration of PFSUSB Registers. Cfg_cmp bit set to 1 once configuration is complete. This should then be held at 1 during functional mode. Similarly auto_mem and dma_cfg settings are static and should not be modified during block operation. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	cfg_cmp	Register Configuration Complete Indication. Posedge is detected on this bit. Hence a 0 to 1 transition is required. 0: Configuration in progress. 1: Configuration complete.
6:5	dma_cfg[1:0]	DMA Access Configuration. 00: No DMA. 01: Manual DMA. 10: Auto DMA and Manual DMA. 11: Reserved.
4	auto_mem	Auto / Manual Memory Configuration. 0: Manual Memory Config (CPU). 1: Auto Memory Configl

1.3.611   USB_USB_CLK_EN

USB Block Clock Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_USB_CLK_EN: 0x4000609D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							csr_clk_en

USB Block Clock Enable Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	csr_clk_en	Clock Enable for Core Logic clocked by AHB bus clock

1.3.612   USB_ARB_INT_EN

Arbiter Interrupt Enable

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_INT_EN: 0x4000609E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R	R	R	R	R	R	R	R
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_intr_en	ep7_intr_en	ep6_intr_en	ep5_intr_en	ep4_intr_en	ep3_intr_en	ep2_intr_en	ep1_intr_en

Arbiter Interrupt Enable Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_intr_en	EP8 Interrupt Enable. 0: Do not raise EP8 Interrupt. 1: Raise EP8 Interrupt
6	ep7_intr_en	EP7 Interrupt Enable. 0: Do not raise EP7 Interrupt. 1: Raise EP7 Interrupt
5	ep6_intr_en	EP6 Interrupt Enable. 0: Do not raise EP6 Interrupt. 1: Raise EP6 Interrupt
4	ep5_intr_en	EP5 Interrupt Enable. 0: Do not raise EP5 Interrupt. 1: Raise EP5 Interrupt
3	ep4_intr_en	EP4 Interrupt Enable. 0: Do not raise EP4 Interrupt. 1: Raise EP4 Interrupt
2	ep3_intr_en	EP3 Interrupt Enable. 0: Do not raise EP3 Interrupt. 1: Raise EP3 Interrupt
1	ep2_intr_en	EP2 Interrupt Enable. 0: Do not raise EP2 Interrupt. 1: Raise EP2 Interrupt
0	ep1_intr_en	EP1 Interrupt Enable. 0: Do not raise EP1 Interrupt. 1: Raise EP1 Interrupt

1.3.613   USB_ARB_INT_SR

Arbiter Interrupt Status

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_INT_SR: 0x4000609F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0	R:0	R:0	R:0	R:0	R:0	R:0	R:0
HW Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	ep8_intr	ep7_intr	ep6_intr	ep5_intr	ep4_intr	ep3_intr	ep2_intr	ep1_intr

Arbiter Status Register. This is an Interrupt Status Register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7	ep8_intr	EP8 Interrupt Status. 0: EP8 Interrupt not raised. 1: EP8 Interrupt Present
6	ep7_intr	EP7 Interrupt Status. 0: EP7 Interrupt not raised. 1: EP7 Interrupt Present
5	ep6_intr	EP6 Interrupt Status. 0: EP6 Interrupt not raised. 1: EP6 Interrupt Present
4	ep5_intr	EP5 Interrupt Status. 0: EP5 Interrupt not raised. 1: EP5 Interrupt Present
3	ep4_intr	EP4 Interrupt Status. 0: EP4 Interrupt not raised. 1: EP4 Interrupt Present
2	ep3_intr	EP3 Interrupt Status. 0: EP3 Interrupt not raised. 1: EP3 Interrupt Present
1	ep2_intr	EP2 Interrupt Status. 0: EP2 Interrupt not raised. 1: EP2 Interrupt Present
0	ep1_intr	EP1 Interrupt Status. 0: EP1 Interrupt not raised. 1: EP1 Interrupt Present

1.3.614 USB_ARB_EP3_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP3_CFG: 0x400060A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.615 USB_ARB_EP3_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP3_INT_EN: 0x400060A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_e n	dma_gnt_e n	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

1.3.616   USB_ARB_EP3_SR

Endpoint Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP3_SR: 0x400060A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.617   USB_ARB_RW3_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW3_WA: 0x400060A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.618   USB_ARB_RW3_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW3_WA_MSB: 0x400060A5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.619   USB_ARB_RW3_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW3_RA: 0x400060A6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.620   USB_ARB_RW3_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW3_RA_MSB: 0x400060A7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.621   USB_ARB_RW3_DR

Endpoint Data Register

Reset: N/A

Register : Address

USB_ARB_RW3_DR: 0x400060A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.622   USB_CWA

Common Area Write Address

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_CWA: 0x400060AC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	cwa							

Write Address Pointer for Common Area; LSB 8 bits of the 9 bit pointer are stored in this register. This register is only valid in Mode3 operation. Although it is R/W register for CPU, all intended updates are performed by the block and CPU can access the value for debug purposes. This register will indicate the Common Area location in memory. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	cwa[7:0]	Write Address for Common Area

1.3.623   USB_CWA_MSB

Common Area Write Address

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_CWA_MSB: 0x400060AD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							cwa_msb

Write Address Pointer for Common Area; MSB of the 9 bit pointer are stored in this register. This register is only valid in Mode3 operation. Although it is R/W register for CPU, all intended updates are performed by the block and CPU can access the value for debug purposes. This register will indicate the Common Area location in memory. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	cwa_msb	Write Address for Common Area

1.3.624 USB_ARB_EP4_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP4_CFG: 0x400060B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.625 USB_ARB_EP4_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP4_INT_EN: 0x400060B1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

1.3.626   USB_ARB_EP4_SR

Endpoint Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP4_SR: 0x400060B2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.627   USB_ARB_RW4_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW4_WA: 0x400060B4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.628   USB_ARB_RW4_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW4_WA_MSB: 0x400060B5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.629   USB_ARB_RW4_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW4_RA: 0x400060B6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.630 USB_ARB_RW4_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW4_RA_MSB: 0x400060B7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.631   USB_ARB_RW4_DR

Endpoint Data Register

Reset: N/A

Register : Address

USB_ARB_RW4_DR: 0x400060B8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.632   USB_DMA_THRES

DMA Burst / Threshold Configuration

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_DMA_THRES: 0x400060BC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	dma_ths							

It contains 8 LSB bits of DMA Threshold Register This register is only valid in Mode3 operation. This register should be programmed to the same value as the DMA Burst Count programmed in the corresponding Channel Basic Config Register in PHUB. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dma_ths[7:0]	8 Lsb bits of 9 bit DMA Threshold count.

1.3.633   USB_DMA_THRES_MSB

DMA Burst / Threshold Configuration

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_DMA_THRES_MSB: 0x400060BD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							dma_ths_msb

It contains the MSB bit of DMA Threshold Register This register is clocked with AHB Bus Clock

Bits	Name	Description
0	dma_ths_msb	Msb bit of 9 bit DMA Threshold count.

1.3.634   USB_ARB_EP5_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP5_CFG: 0x400060C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.635   USB_ARB_EP5_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP5_INT_EN: 0x400060C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_e n	dma_gnt_e n	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

1.3.636 USB_ARB_EP5_SR

Endpoint Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP5_SR: 0x400060C2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset		NA:0000			R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access		NA			R/W	R/W	R/W	R/W
Retention		NA			NONRET	NONRET	NONRET	NONRET
Name		RSVD			buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.637 USB_ARB_RW5_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW5_WA: 0x400060C4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.638   USB_ARB_RW5_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW5_WA_MSB: 0x400060C5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.639   USB_ARB_RW5_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW5_RA: 0x400060C6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.640   USB_ARB_RW5_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW5_RA_MSB: 0x400060C7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.641   USB_ARB_RW5_DR

Endpoint Data Register

Reset: N/A

Register : Address

USB_ARB_RW5_DR: 0x400060C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.642   USB_BUS_RST_CNT

Bus Reset Count Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_BUS_RST_CNT: 0x400060CC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset		NA:0000				R/W:1010		
HW Access		NA				R		
Retention		NA				NONRET		
Name		RSVD				bus_rst_cnt		

Bus Reset Count register ; For USB bus reset length; The value in this register determines the no. of pulses of the low freq. clock which will be counted to determine if an SE0 condition has been held for long enough to declare a USB Bus reset condition. In krypton, 3 pulses of a 32 KHz clock were counted to declare a usb bus reset condition. In leopard, a 100 KHz clock is used. Recommended is to count 10 pulses of this clock to remain equivalent to Krypton. This register is clocked with AHB Bus Clock

Bits	Name	Description
3:0	bus_rst_cnt[3:0]	Bus Reset Count Length

1.3.643   USB_ARB_EP6_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP6_CFG: 0x400060D0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.644   USB_ARB_EP6_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP6_INT_EN: 0x400060D1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

1.3.645   USB_ARB_EP6_SR

Endpoint Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP6_SR: 0x400060D2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.646 USB_ARB_RW6_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW6_WA: 0x400060D4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.647   USB_ARB_RW6_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW6_WA_MSB: 0x400060D5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.648   USB_ARB_RW6_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW6_RA: 0x400060D6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.649   USB_ARB_RW6_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW6_RA_MSB: 0x400060D7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.650 USB_ARB_RW6_DR

Endpoint Data Register

Reset: N/A

Register : Address

USB_ARB_RW6_DR: 0x400060D8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.651   USB_ARB_EP7_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP7_CFG: 0x400060E0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s
1	dma_req	Manual DMA Request for a particular (1 to 8) endpoint; 0 to 1 Transition detected => Edge Sensitive. 0: No DMA Request. 1: Raise DMA Request
0	in_data_rdy	Indication that Endpoint Packet Data is Ready in Main memory; Level Sensitive.

1.3.652   USB_ARB_EP7_INT_EN

Endpoint Interrupt Enable Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP7_INT_EN: 0x400060E1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			NONRET	NONRET	NONRET	NONRET	NONRET
Name	RSVD			err_int_en	buf_under_en	buf_over_en	dma_gnt_en	in_buf_full_en

Endpoint Interrupt Enable Register This register is clocked with AHB Bus Clock

Bits	Name	Description
4	err_int_en	Endpoint Error in Transaction Interrupt Enable
3	buf_under_en	Endpoint Buffer Underflow Enable
2	buf_over_en	Endpoint Buffer Overflow Enable
1	dma_gnt_en	Endpoint DMA Grant Enable
0	in_buf_full_en	IN Endpoint Local Buffer Full Enable

1.3.653 USB_ARB_EP7_SR

Endpoint Status Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP7_SR: 0x400060E2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	NA				R/W	R/W	R/W	R/W
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				buf_under	buf_over	dma_gnt	in_buf_full

Endpoint Status Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	buf_under	Endpoint Buffer Underflow Indication
2	buf_over	Endpoint Buffer Overflow Indication
1	dma_gnt	Endpoint DMA Grant Indication
0	in_buf_full	IN Endpoint Local Buffer Full Indication

1.3.654   USB_ARB_RW7_WA

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW7_WA: 0x400060E4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	wa							

Write Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	wa[7:0]	Write Address for EP

1.3.655   USB_ARB_RW7_WA_MSB

Endpoint Write Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW7_WA_MSB: 0x400060E5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							wa_msb

Write Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	wa_msb	Write Address for EP

1.3.656   USB_ARB_RW7_RA

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW7_RA: 0x400060E6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	ra							

Read Address Pointer for Endpoint ; LSB 8 bits of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	ra[7:0]	Read Address for EP

1.3.657   USB_ARB_RW7_RA_MSB

Endpoint Read Address value

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_RW7_RA_MSB: 0x400060E7

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R/W
Retention	NA							NONRET
Name	RSVD							ra_msb

Read Address Pointer for Endpoint ; MSB 1 bit of the 9 bit pointer are stored in this register. This register is clocked with AHB Bus Clock

Bits	Name	Description
0	ra_msb	Read Address for EP

1.3.658 USB_ARB_RW7_DR

Endpoint Data Register

Reset: N/A

Register : Address

USB_ARB_RW7_DR: 0x400060E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	dr							

Data Register for Endpoint ; This register is clocked with AHB Bus Clock

Bits	Name	Description
7:0	dr[7:0]	Data Register for EP ; This register is linked to the memory, hence reset value is undefined.

1.3.659   USB_ARB_EP8_CFG

Endpoint Configuration Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

USB_ARB_EP8_CFG: 0x400060F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				NONRET	NONRET	NONRET	NONRET
Name	RSVD				reset_ptr	crc_bypass	dma_req	in_data_rdy

Endpoint Configuration Register This register is clocked with AHB Bus Clock

Bits	Name	Description
3	reset_ptr	Configuration Setting to Reset the RA and WA Pointers to their start values at the End of Packet transaction. 0: Do not Reset Pointer; Krypton Backward compatibility mode; 1: Reset Pointer; recommended value for reduction of CPU Configuration Writes.
2	crc_bypass	Configuration Setting to prevent CRC bytes from being written to memory and being read by firmware 0: No CRC bypass; CRC bytes will be written to memory and Termin will be generated for the CRC byte/s 1: CRC Bypass Set; CRC bytes will not be written into memory and Termin will be generated for the last data byte/s

Retention	NA			RET	RET	RET		
Name	RSVD			dmac_idle	dmac_en	bus_timeout		

This is the general configuration register for the PHUB

Bits	Name	Description
28	dmac_idle	Indicates whether the DMAC is currently IDLE or not
27	dmac_en	Global DMAC enable
26:24	bus_timeout[2:0]	Specifies the number of wait states (!HREADY responses by an accessed peripheral) PHUB will allow before timing out the AHB transaction. On a bus timeout PHUB will act as if it received a positive HREADY from the peripheral then move onto the next natural transaction as it would normally. The BUS_TIMEOUT bit of the ERR register will be set upon detecting the timeout. See Table 1-728.
23	simple_pri	0: Grant allocation fairness algorithm enabled 1: Grant allocation fairness algorithm disabled; simple priority utilized

1.3.1104   PHUB_CFG (continued)

22:16	pri_int_en[6:0]	0: Priority can not interrupt lower priority channels 1: Priority can interrupt lower priority channels Bits 22:16 correspond to priorities 6:0. Priority 7 is the lowest priority and thus can not interrupt yet lower priorities and therefore there is no bit for it.
7:1	spk_cpu_pri[6:0]	0: DMA priority spoke 1: CPU priority spoke Bits 15:1 correspond to spokes 15:1 respectively. SPK0 is not accessible by the CPU and thus no bit exists for it. The number of valid SPKxx_CPU_PRI bits is determined by the cfg_num_of_spk[4:0] input to PHUB; non-configured bits are hardwired to 0.
0	cpu_clkdif	0: CPU_CLOCK_EN assumed tied to 1; Performance Mode 1: CPU_CLOCK_EN assumed to modulate; Mixed Frequency Mode

Table 1-728. Bit field encoding: BUS_TIMEOUT_ENUM

Value	Name	Description
3'b000	Timeout_0	Disable bus timeout detection
3'b001	Timeout_1	8 wait states
3'b010	Timeout_2	16 wait states
3'b011	Timeout_3	32 wait states
3'b100	Timeout_4	64 wait states
3'b101	Timeout_5	128 wait states
3'b110	Timeout_6	256 wait states
3'b111	Timeout_7	511 wait states (default)

1.3.1105 PHUB_ERR

PHUB Error Detection

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

PHUB_ERR: 0x40007004

Bits	7	6	5	4	3	2	1	0

PHUB detects the following errors: 1. Bus Timeout 2. Unpopulated address access 3. Peripheral AHB ERROR response   If the error was detected as a result of a CPU access then PHUB will send an AHB ERROR response to the CPU. If the error was detected as a result of either a CPU or DMA access then PHUB will set the corresponding bit in the following ERR register.

Bits	Name	Description
3	periph_err	Set to 1 when a peripheral responds to a bus transaction with an AHB ERROR response. Cleared by writing a 1.
2	unpop_acc	Set to 1 when an access is attempted to an address that does not decode to any spoke HSEL. Cleared by writing a 1.
1	bus_timeout	Set to 1 when a bus timeout occurs. Cleared by writing a 1. Timeout values are determined by the BUS_TIMEOUT field in the PHUBCFG register.

1.3.1106 PHUB_ERR_ADR

PHUB Error Address

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

PHUB_ERR_ADR: 0x40007008

Each channel will have the following basic configuration stored in gates inside PHUB.

Bits	Name	Description
5	work_sep	If a TD requires multiple bursts DMAC must remember where it left off between bursts while allowing interleaving other channels' bus access. It can either store the intermediate TD states on top of the current CHn_ORIG_TD0/1 of the TD chain, OR it can store it separately in a working area called CHn_SEP_TD0/1. The latter allows the original TD chain to be preserved. 0: Store the intermediate and final TD states on top of the original TD chain. Intermediate state storage allows the CPU to gauge progress of a particular TD. Final state storage allows the CPU to 'walk the chain' later and see what the final completion state of each TD was. 1: Store the intermediate TD states separately in CHn_SEP_TD0/1 to preserve the original TD chain. Intermediate state storage allows the CPU to gauge progress of a particular TD. Note the final state of each TD is not stored anywhere in this case. CHn_SEP_TD0/1 is stored in TDMEM and the address is: {00, CH_NUM[5:0], 000} In other words the slot in TDMEM that equals the channel number becomes reserved for DMAC's private use. Instead of processing the original TDs in place, DMAC will copy the original TDs to this separate working area and process them there. Because of this the separate working area is considered reserved and no real TDs should be stored there.
4	rr_en	Round-Robin enable RR_EN is only valid if the cfg_ch_recent_cnt_size[2:0] input to PHUB is not zero; otherwise RR_EN is hardwired to zero.
3:1	pri[2:0]	Channel priority; see DMA Arbiter section for description of channel priorities
0	en	0: Channel is disabled from accepting requests. This is the default state of the channel and allows the channel to be fully configured before enabling. This can also be used to stall a chain. If TD_ACTIVE=0 then clearing this bit will prevent any further DMA requests from being accepted by the channel until ENABLE is set again. If TD_ACTIVE=1 then DMAC will allow the current burst to finish naturally. Then when DMAC returns to the IDLE state it will prevent any further DMA requests from being accepted by the channel until ENABLE is set again. If a TD chain finishes due to NEXT_TD_PTR=0xFE then the ENABLE bit will be cleared automatically (this is not the case if the TD chain finishes due to NEXT_TD_PTR=0xFF). 1: Channel is enabled and will accept DMA requests for it. While the channel is enabled any other configuration information for the channel should NOT be altered to ensure graceful operation. This includes the channel's BASIC_CFG, BASIC_STATUS, CFG0/1, and associated TDs.

1.3.1108   PHUB_CH[0..23]_ACTION (continued)

Retention	NA
Name	RSVD

Each channel will have the following action register associated with it:

Bits	Name	Description
2	cpu_term_chain	Setting this bit causes the TD chain to terminate and the channel's ENABLE and CHAIN_ACTIVE bits to clear. If TD_ACTIVE=0 setting this bit will effectively create a request for the channel. When the request wins the DMAC will do some housekeeping associated with terminating a chain which includes clearing the channel's ENABLE, CHAIN_ACTIVE and CPU_TERM_CHAIN bits. If TD_ACTIVE=1 then DMAC will terminate the current burst as soon as any outstanding AHB requests are completed. The channel's ENABLE, CHAIN_ACTIVE and CPU_TERM_CHAIN bits will be cleared when the DMAC returns to the IDLE state.
1	cpu_term_td	Setting this bit causes the current TD to terminate regardless of the status of the XFRCNT associated with the TD. If TD_ACTIVE=0 the CPU_TERM_TD bit will just wait in the background. When the channel is eventually requested and serviced by DMAC the data burst will be preempted and the TD will complete just as if XFRCNT had expired. When the DMAC FSM returns to the IDLE state it will clear the CPU_TERM_TD bit. If TD_ACTIVE=1 then DMAC will terminate the current burst as soon as any outstanding AHB requests are completed. The TD will them complete just as if XFRCNT had expired. When the DMAC FSM returns to the IDLE state it will clear the CPU_TERM_TD bit.
0	cpu_req	Setting this bit creates a direct DMA request for the channel. If TD_ACTIVE=0 CPU_REQ will remain set until the request wins arbitration and is accepted by DMAC. This bit is cleared upon triggering the DMAC FSM from the IDLE state. If TD_ACTIVE=1 CPU_REQ will remain set and will apply to the next burst for the channel. The bit will essentially be ignored by DMAC and will be left alone so that it can trigger the next burst for the channel.

Each channel will have the following status information stored in gates inside PHUB

Bits	Name	Description
14:8	td_ptr[6:0]	Address pointer to the current CHn_ORIG_TD0/1 in the chain. The CPU initializes this to the location of the first TD in the chain before enabling the channel. DMAC updates TD_PTR with NEXT_TD when it completes the current TD. This gives status to the CPU of how far along the chain is and where it is. The CHn_ORIG_TD0/1 chain is stored in TDMEM and DMAC accesses the current TD at: {TD_PTR[7:0], 000} The number of valid TD_PTR bits is determined by the cfg_ch_td_ptr_size[3:0] input to PHUB; non-configured bits are hardwired to 0. br] TD_PTR resets to the same value as the channel number.
7:4	rr_cnt[3:0]	Current state of the channel's Round-Robin counter. The lower the value the more recently the channel has won a DMA grant with zero meaning it won the last grant. 0: RR_CNT will be frozen on the terminal count (all ones) and therefore it will look as if the channel has never received a DMA grant which will give it an advantage over channels that do support Round-Robin. Put another way, when RR_EN=0 the channel is not subject to Round-Robin rules. 1: RR_CNT will reset each time the channel wins a DMA grant. It will increment each time any other channel wins a DMA grant. It will stop incrementing when it hits the terminal count (all ones). The number of valid RR_CNT bits is determined by the cfg_ch_recent_cnt_size[2:0] input to PHUB; non-configured bits are hardwired to 0.
2	drq	0: hardware DRQ bit is not set 1: hardware DRQ bit is set and is awaiting service by DMAC; will be cleared by DMAC when serviced or by SW by writing a 1
1	td_active	0: channel is not currently being serviced by DMAC 1: channel is currently being serviced by DMAC
0	chain_active	0: TD chain is inactive; either no DMA requests have triggered a new chain or the previous chain has completed. 1: TD chain has been triggered by a DMA request

Name	burstcount_remain							RSVD

Each channel will have some configuration information stored in RAM, and this configuration information is called CHn_CFG0/1. CHn_CFG0/1 are stored in CFGMEM at {CH_NUM[5:0], 000}. Chn_CFG0/1 are described in detail below.

Bits	Name	Description
31:25	burstcount_remain[6:0]	These bits are reserved for use by the DMAC in storing the intermediate state of BURSTCNT in the event that the channel is interrupted mid-burst by a higher priority channel. These bits need to be preserved by SW only if the channel is active and interrupt-able. Otherwise SW can over-write these bits without concern, for instance when initially setting up the configuration for the channel.
20	wait_udb_flag_settle	UDB FIFO flags may be used directly as a DRQ to the DMAC. However, these flags can take multiple cycles to settle. Setting this bit instructs the DMAC to wait an extra cycle after finishing a DMA for this channel before considering a new DRQ. Otherwise a DRQ may be interpreted prematurely.
19:16	termin_sel[3:0]	Selects 1 of the 16 TERMIN[15:0] inputs to PHUB for use in terminating a TD. Any active high strobe on the TERMIN signal will be positive edge detected and will cause the TD to terminate if TERMIN_EN is set in the TD. The TD will complete just as if XFRCNT expired.
15:12	termout1_sel[3:0]	Selects 1 of the 16 TERMOUT1[15:0] outputs from PHUB to be toggled upon completion of the current TD if TERMOUT1_EN is set in the TD. Because the frequency of the receiving logic for the TERMOUT1 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT1 signal and interpret either as the completion of the current TD.
11:8	termout0_sel[3:0]	Selects 1 of the 16 TERMOUT0[15:0] outputs from PHUB to be toggled upon completion of the current TD if TERMOUT0_EN is set in the TD. Because the frequency of the receiving logic for the TERMOUT0 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT0 signal and interpret either as the completion of the current TD.

1.3.1110   PHUB_CFGMEM[0..23]_CFG0 (continued)

7	req_per_burst	0: A DMA request is required to activate each TD in the chain. If the TD requires multiple bursts to complete then all subsequent bursts after the first burst will be automatically requested and carried out. DMAC will set the AUTO_BURST_WHOLE_TD request after completing each burst except the last. 1: A DMA request is required to activate each TD in the chain. If the TD requires multiple bursts to complete then all subsequent bursts after the first burst must also be individually requested.
6:0	burstcnt[6:0]	The data block moved by a TD can be broken up into small bursts. BURSTCNT[6:0] specifies the length of the small burst from 1 to 127 bytes. If BURSTCNT=0 this means do not break the data block into small bursts and instead burst the whole XFRCNT in one burst. The number of valid BURSTCNT bits is determined by the cfg_burstcnt_size[2:0] input to PHUB; non-configured bits are ignored by the DMAC.

Each channel will have some configuration information stored in RAM, and this configuration information is called CHn_CFG0/1. CHn_CFG0/1 are stored in CFGMEM at {CH_NUM[5:0], 000}. Chn_CFG0/1 are described in detail below.

Bits	Name	Description
31:16	dst_base_adr[15:0]	Base address used for the destination address. Concatenates with DST_ADR[15:0] from the TD to form the full address.
15:0	src_base_adr[15:0]	Base address used for the source address. Concatenates with SRC_ADR[15:0] from the TD to form the full source address.

Each channel will have a TD chain (as short as one TD in length) that provides instructions to the DMAC for carrying out a DMA sequence for the channel. This is described in greater detail in the 'TD Chains' section to follow. The TD chain is comprised of one or more CHn_ORIG_TD0/1 TDs.   DMAC accesses the CHn_ORIG_TD0/1 chain from TDMEM and the address in TDMEM of the current TD in the chain is {TD_PTR[7:0], 000}.   TD_PTR for the first TD in a chain is initialized by the CPU. As the chain progresses through TDs the TD_PTR will be automatically updated by DMAC to reflect the current TD being accessed in the chain.   CHn_ORIG_TD0/1 are described in detail below.

Bits	Name	Description
31	swap_en	0: Do not perform endian swap 1: Perform endian swap. BURSTCNT and XFRCNT must be an integer multiple of SWAP_SIZE.
30	swap_size	Only valid if SWAP_EN=1. 0: Swap size = 2 bytes, meaning every 2 bytes are endian swapped during the DMA transfer. 1: Swap size = 4 bytes, meaning every 4 bytes are endian swapped during the DMA transfer.
29	auto_exec_next	0: The next TD in the chain requires a CPU_REQ or peripheral request in order to trigger 1: The next TD in the chain will trigger automatically when the current TD completes. The DMAC will create an AUTO_EXEC_NEXT_TD request for the channel when it completes the current TD.
28	termin_en	0: Do not terminate this TD based on a TERMIN signal. 1: Terminate this TD if a positive edge on the TERMIN signal selected by TERMIN_SEL is detected. Any ongoing burst will terminate as soon as any outstanding AHB requests have been completed. The TD will then complete just as if XFRCNT expired.
27	termout1_en	0: Do not toggle a TERMOUT1 signal when this TD completes 1: When this TD completes the TERMOUT1 signal selected by TERMOUT1_SEL will toggle. Because the frequency of the receiving logic for the TERMOUT1 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT1 signal and interpret either as the completion of the current TD.
26	termout0_en	0: Do not toggle a TERMOUT0 signal when the TD completes 1: When this TD completes the TERMOUT0 signal selected by TERMOUT0_SEL will toggle. Because the frequency of the receiving logic for the TERMOUT0 signal is unknown by PHUB the signal is simply toggled and the receiving logic should be capable of detecting either a positive or negative edge on the TERMOUT0 signal and interpret either as the completion of the current TD.
25	inc_dst_adr	0: Freeze DST_ADR throughout the burst 1: Increment DST_ADR according to the size of each data transaction in the burst
24	inc_src_adr	0: Freeze SRC_ADR throughout the burst 1: Increment SRC_ADR according to the size of each data transaction in the burst

1.3.1112   PHUB_TDMEM[0..127]_ORIG_TD0 (continued)

23:16	next_td_ptr[7:0]	Specifies the next TD to be executed in the chain when this TD completes. When this TD completes the value of NEXT_TD_PTR is copied into the TD_PTR status register to allow the CPU to see where in the chain the channel is. If NEXT_TD_PTR=0xFE or 0xFF then this is the last TD in the chain. When the last TD in a chain completes DMAC will clear CHAIN_ACTIVE and if NEXT_TD_PTR=0xFE then ENABLE will clear as well.
11:0	xfrcnt[11:0]	Transfer count in bytes from 1 to 4KB-1, or indefinite transfer count if set to 0. 1. Setting XFRCNT to 0: This means transfer count is not used to terminate the TD. An indefinite amount of data can be transferred in this mode. The TD must be terminated either by TERMIN, CPU_TERM_TD or CPU_TERM_CHAIN. Data movement is broken into bursts according to BURSTCNT. Note in the special case where both XFRCNT and BURSTCNT are 0 data will be transferred indefinitely and without interruption. 2. Setting XFRCNT to non-0: This means the XFRCNT is used to determine how much data will be transferred (1 to 4KB-1). If BURSTCNT=0 then DMAC will transfer the entire XFRCNT worth of data in one burst. If BURSTCNT is not 0 and BURSTCNT represents a value that is greater than or equal to XFRCNT then DMAC will transfer the entire XFRCNT worth of data in one burst. If BURSTCNT is not 0 and BURSTCNT represents a value that is less than XFRCNT then DMAC will break the data movement into multiple bursts as dictated by BURSTCNT. See the description for the REQ_PER_BURST bit for how subsequent bursts are triggered. At any point the TD can terminate before exhausting the XFRCNT due to TERMIN, CPU_TERM_TD or CPU_TERM_CHAIN. When DMAC updates the TD (whether it's the CHn_ORIG_TD0/1 or CHn_SEP_TD0/1) at the end of a burst it will update the XFRCNT to reflect the newly decremented value based on the number of bytes that were transferred in the burst. The number of valid XFRCNT bits is determined by the cfg_xfrcnt_size[4:0] input to PHUB; non-configured bits are ignored by the DMAC.

Each channel will have a TD chain (as short as one TD in length) that provides instructions to the DMAC for carrying out a DMA sequence for the channel. This is described in greater detail in the 'TD Chains' section to follow. The TD chain is comprised of one or more CHn_ORIG_TD0/1 TDs.   DMAC accesses the CHn_ORIG_TD0/1 chain from TDMEM and the address in TDMEM of the current TD in the chain is {TD_PTR[7:0], 000}.   TD_PTR for the first TD in a chain is initialized by the CPU. As the chain progresses through TDs the TD_PTR will be automatically updated by DMAC to reflect the current TD being accessed in the chain.   CHn_ORIG_TD0/1 are described in detail below.

Bits	Name	Description
31:16	dst_adr[15:0]	Specifies the lower portion of the full destination address by concatenating with DST_BASE_ADR from CHn_CFG1. Can be incremented or not depending on the setting of INC_DST_ADR. Only DST_ADR will increment; DST_BASE_ADR will remain static. Therefore, separate TDs should be used to cross 64KB address boundaries. If INC_DST_ADR=1 then when DMAC updates the TD (whether it's the CHn_ORIG_TD0/1 or CHn_SEP_TD0/1) at the end of a burst it will update DST_ADR to reflect the newly incremented value based on the number of bytes that were transferred to the destination during the burst.
15:0	src_adr[15:0]	Specifies the lower portion of the full source address by concatenating with SRC_BASE_ADR from CHn_CFG1. Can be incremented or not depending on the setting of INC_SRC_ADR. Only SRC_ADR will increment; SRC_BASE_ADR will remain static. Therefore, separate TDs should be used to cross 64KB address boundaries. If INC_SRC_ADR=1 then when DMAC updates the TD (whether it's the CHn_ORIG_TD0/1 or CHn_SEP_TD0/1) at the end of a burst it will update SRC_ADR to reflect the newly incremented value based on the number of bytes that were transferred from the source during the burst.

This is the Interrupt Enable bit. 0 interrupt disabled. 1 interrupt enables, successful message transmission sets the TxMsg flag in the Interrupt Controller.

Bits	Name	Description
31:24	RSVD2[7:0]	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
23	wpn2	Write protection for bits [21:16]. 0 = Bits [21:16] are write protected. 1 = Bits [21:16] are modified by writes. The wpn2 bit must always be set in the same write that is modifying bits [21:16] as these bit's states are not preserved. The readback value of the wpn2 bit is undefined.

1.3.1121   CAN[0..0]_TX[0..7]_CMD (continued)

22	RSVD1	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
21	rtr	RTR Remote bit. 0 Standard message, 1 RTR message
20	ide	Extended identifier. 0 Standard format message, 1 Extended format message
19:16	dlc[3:0]	Data Length of the Tx Msg. Invalid values are transmitted as they are, but the number of data bytes is limited to eight. 0 Message has 0 data byte, data[63:0] is not used, 1 Message has 1 data byte, data[63:56] is used, ..., 8 Message has 8 data bytes, data [63:0] is used, 9-15 Message has 8 data bytes
15:8	RSVD0[7:0]	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
3	wpn1	Write protection for bit [2]. 0 = Bit [2] is write protected. 1 = Bit [2] is modified by writes. The wpn1 bit must always be set in the same write that is modifying bit [2] as this bit's state is not preserved. The wpn1 bit is always zero for readback.
2	txint_ebl	Transmit Interrupt Enable. 0 Interrupt disabled, 1 Interrupt enabled, succesful message transmission setst the TxMsg flag in the interrupt controller
1	txabort	Transmit Abort Request. 0 idle, 1 Requests removal of a pending message. The message is removed the next time an arbitration loss happened. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time
0	txreq	Transmit Request. For Write: 0 Idle, 1 Message Transmit request. For Read: 0 TxReq completed, 1 TxReq pending

Rx Msg Control register have recieve interrupt enable,buffer enable,link flag,identifier

Bits	Name	Description

1.3.1125   CAN[0..0]_RX[0..15]_CMD (continued)

31:24	RSVD2[7:0]	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
23	wpnh	Write protection for bits [21:16]. 0 = Bits [21:16] are write protected. 1 = Bits [21:16] are modified by writes. The wpnh bit must always be set in the same write that is modifying bits [21:16] as these bit's states are not preserved. The readback value of the wpnh bit is undefined.
22	RSVD1	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
21	rtr	RTR Remote Bit.0 This is a regular message, 1 This is an RTR message
20	ide	Extended Identifier Bit. 0 This is a standard format message, 1 This is an extended format message
19:16	dlc[3:0]	Data Length Code. 0 Message has 0 data bytes, data[63:0] is not valid, 1 Message has 1 data byte, data[63:56] is valid, ..., 8 Message has 8 data bytes, data [63:0] is valid, 9-15 Message has 8 data bytes
15:8	RSVD0[7:0]	Reserved bits. Since data read from these bits is from memory, the value at reset is undefined
7	wpnl	Write protection for bits [6:3]. 0 = Bits [6:3] are write protected. 1 = Bits [6:3] are modified by writes. The wpnl bit must always be set in the same write that is modifying bits [6:3] as these bit's states are not preserved. The wpnl bit is always zero for readback.
6	lk_flg	Link Flag used to link the Rx Buffer. 0 This buffer is not linked to the next, 1 This biffer is linked with the next buffer
5	rx_int_ebl	Recieve Interrupt Enable. 0 Interrupt generation is disabled, 1 Interrupt generation is enabled
4	rtr_rply	Automatic RTR Message Handling. 0 Automatic RTR message handling disabled, 1 Automatic RTR message handling enabled
3	buf_ebl	Buffer Enable. 0 Buffer is disabled, 1 Buffer is enabled
2	rtr_abort	RTR Abort Request. 0 Idle, 1 Requests removal of a pending RTR message reply. The flag is cleared when the message was removed or when the message won arbitration. The TxReq flag is released at the same time.
1	rtr_rpy_pnd	RTR Reply request Pending. 0 No RTR reply request pending, 1 RTR reply request pending
0	msg_av	Message Available. For Read: 0 No new message available, 1 New message available. For Write: 0 Idle, 1 Acknowledges receipt of new message

HW Access	NA					R	R	R
Retention	NA					NONRET	NONRET	NONRET
Name	RSVD					CORECLK_DISABLE	ADDR6	RUN

This register enables/disables DFB operation and sets FSM memory bank. Also, the internal core clock gater is controlled. A read of this register produces the last value written to this register.

Bits	Name	Description
2	CORECLK_DISABLE	This bit when set high disables (gates off) the clock to the entire core of the block. This includes all FFs except those used for the AHB interface and CSRs and all 6 RAMs. When disabled (set high) the AHB interface to the CSR is still fully functional. This bit is ANDed with the primary input signal dfb_clk_en to control the clock gate. dfb_clk_en must be high and CoreCLK_Disable must be low for the clock to run. See Table 1-730.
1	ADDR6	This bit is literally address bit 5 (6th bit) of the FSM RAM when addressed by the DFB Controller. It has no affect on the FSM RAM when addressed on the AHB interface. It controls the Banking feature of the FSM. See Table 1-729.
0	RUN	Setting this bit to 1 enables the DFB to run. Setting it to 0 forces the next state address of the FSM to zero of the active Bank, reinitializes the ACU's and PC's and clears the round flag, saturation flag, saturation detect flag and all 6 extended Enables in the Controller. See Table 1-731.

Table 1-729. Bit field encoding: addr6_enum

Value	Name	Description
1'b1	ADDR6_HIGH	ADDR6 is High
1'b0	ADDR6_LOW	ADDR6 is Low

Table 1-730. Bit field encoding: coreclk_disable_enum

Value	Name	Description
1'b1	CORECLK_DISABLE_HIGH	Core Clock is Disabled (gated)
1'b0	CORECLK_DISABLE_LOW	Core Clock is Enabled

Table 1-731. Bit field encoding: run_bit_enum

Value	Name	Description
1'b1	RUN_EN	DFB is enabled to operate.
1'b0	RUN_DIS	DFB operation is halted.

1.3.1140 DFB[0..0]_SR

DFB Status Register

Reset: Reset Signals Listed Below

Register : Address

DFB0_SR: 0x4000C784

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R:U	R:U	R:U
HW Access	W	W	W	W	W	W	W	W
Retention	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET	NONRET
Name	INTR_SEM 2	INTR_SEM 1	INTR_SEM 0	INTR_HOL DB	INTR_HOL DA	RND_MOD E	SAT_MODE	RAM_SEL

This register contains 5 bits indicating the status of block generated interrupts and 3 bits of status from the Datapath unit. Of the 5 sources of interrupts, only those configured in INT_CTRL are activated. If not activated in INT_CTRL they will never assert in this register. If an interrupt source bit (7:3) is set this indicates it is at least one of the sources of the currently driven interrupt on dfb_intr. More than one of the 5 could be asserted. Note that if the system SW wishes to poll for an event and not have an interrupt generated, the interrupt must be enabled in the INT_CTRL register so that it can be polled here and then disable the interrupt in the Interrupt Controller or not connect the dfb_intr signal to the Interrupt Controller at all by not configuring the DSI path. Bits 2:0 are read-only - writes to these bits have no affect. Writes to bits 7:3 of '1' clear the bit, writes of 0 have no affect.

Bits	Name	Description
7	INTR_SEM2	If this bit is high, semaphore register bit 2 is a source of the current interrupt. Write a '1' to this bit to clear it. See Table 1-736.
6	INTR_SEM1	If this bit is high, semaphore register bit 1 is a source of the current interrupt. Write a '1' to this bit to clear it. See Table 1-735.
5	INTR_SEM0	If this bit is high, semaphore register bit 0 is a source of the current interrupt. Write a '1' to this bit to clear it. See Table 1-734.
4	INTR_HOLDB	If this bit is high, Holding register B is a source of the current interrupt. Write a '1' to this bit to clear it. Reading the Holding register B also clears this bit. See Table 1-733.
3	INTR_HOLDA	If this bit is high, Holding register A is a source of the current interrupt. Write a '1' to this bit to clear it. Reading the Holding register A also clears this bit. See Table 1-732.
2	RND_MODE	Indicates that the DP is in Round mode - meaning that any result passing out of the DP unit is being rounded to a 16-bit value. See Table 1-738.

1.3.1140   DFB[0..0]_SR (continued)

1	SAT_MODE	Indicates that the DP unit is in Saturation mode - meaning that any mathematic operation executed that produces a number outside the range of a 24-bit 2's compliment number is clamped to the mode positive or negative number allowed. Saturation mode is set/unset under Assembly control in the DFB Controller.
		See Table 1-739.
0	RAM_SEL	This bit indicates which Control Store memory is in use, RAM A or RAM B.
		See Table 1-737.

Reset Table

Reset Signal	Applicable Register Bit(s)

Value	Name	Description
1'b0	SAT_OFF	Indicates Saturation mode is off.
1'b1	SAT_ON	Indicates Saturation mode is on.

1.3.1141 DFB[0..0]_RAM_EN

DFB RAM Enable Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_RAM_EN: 0x4000C788

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00		R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	R		R	R	R	R	R	R
Retention	RET		RET	RET	RET	RET	RET	RET
Name	RAMWR_ADDRING		DPB_EN	DPA_EN	ACU_EN	CSB_EN	CSA_EN	FSM_EN

This register controls the DFB memory enables. These bits are tied directly to the enable pins of the RAMs in this block and should be used by System SW to power-down RAMs not in use. A read of this register produces the last value written to this register. The high two bits control the RAM overlay addressing.

Bits	Name	Description
7:6	RAMWR_ADDRING[1:0]	These two bits control the write addressing of the 4 largest RAMs embedded in the DFB (CS-A, CS-B, Data-A, Data-B). The setting of these bits allows overlaid writes to occur to these memories when it is desired to fill them with like data. This feature is primarily intended to enhance SW BIST test time but may also have functional uses as well like filling both CS RAMs concurrently as they typically hold identical data. Setting these bits to 01, for example, configures the HW to write to both CS-A and CS-B for any write to the address space of either CS-A or CS-B. Reads are not affected by these bits. See Table 1-741.
5	DPB_EN	Datapath RAM B RAM enable / disable. See Table 1-740.
4	DPA_EN	Datapath RAM A RAM enable / disable. See Table 1-740.
3	ACU_EN	ACU RAM RAM enable / disable. See Table 1-740.
2	CSB_EN	Control Store RAM B RAM enable / disable. See Table 1-740.
1	CSA_EN	Control Store RAM A RAM enable / disable. See Table 1-740.
0	FSM_EN	FSM RAM RAM enable / disable. See Table 1-740.

Table 1-740. Bit field encoding: ram_enable_bit_enum

Value	Name	Description
1'b1	RAM_EN	RAM is enabled.
1'b0	RAM_DIS	RAM is disabled.

1.3.1141   DFB[0..0]_RAM_EN (continued)

Table 1-741. Bit field encoding: ram_write_addressing_bits_enum

Value	Name	Description
2'b00	NO_OVERLAY	No overlay mapping.
2'b11	OVERLAY_CS_A_CS_B	Overlay CS A with CS B.
2'b10	OVERLAY_DATA_A_DATA_B	Overlay Data A with Data B.
2'b11	OVERLAY_CS_AB_DATA_AB	Overlay CS A/B with Data A with DATA B.

1.3.1142 DFB[0..0]_RAM_DIR

DFB RAM Direction Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_RAM_DIR: 0x4000C78C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1	R/W:1
HW Access	NA	R	R	R	R	R	R	R
Retention	NA	RET	RET	RET	RET	RET	RET	RET
Name	RSVD	SNP_DABLE	DPB_DIR	DPA_DIR	ACU_DIR	CSB_DIR	CSA_DIR	FSM_DIR

This register controls the DFB memory direction. These bits control if each RAM of this block is embedded to the DFB function or mapped in the system address space on the AHB bus. Mapping to the bus facilitates SW BIST, Configuration filling, and Block Mode transfers. A read to this register returns what was last written. When programming code into the CSA/B and FSM RAMs the RAM_DIR bits should be set and unset together. When in normal operating mode and the CSA/B, ACU and FSM are being filled with assembly code/data, it is high recommended that all four RAMs DIR bits be set and cleared together.

Bits	Name	Description
6	SNP_DABLE	The CS and DP RAMs (optionally the FSM) have address snooping logic that watches for redundant back-to-back RD cycles and disables the RAM to conserve power. Writing a 1 to this bit disables this logic for all RAMs.
		See Table 1-743.
5	DPB_DIR	Datapath RAM B RAM Direction.
		See Table 1-742.
4	DPA_DIR	Datapath RAM A RAM Direction.
		See Table 1-742.
3	ACU_DIR	ACU RAM RAM Direction.
		See Table 1-742.
2	CSB_DIR	Control Store RAM B RAM Direction.
		See Table 1-742.
1	CSA_DIR	Control Store RAM A RAM Direction.
		See Table 1-742.
0	FSM_DIR	FSM RAM RAM Direction.
		See Table 1-742.

Table 1-742. Bit field encoding: ram_direction_bit_enum

Value	Name	Description
1'b1	RAM_AHB	System Bus
1'b0	RAM_DFB	DFB

1.3.1142   DFB[0..0]_RAM_DIR (continued)

1'b1	SNP_DISABLE	Disabled
1'b0	SNP_ENABLE	Enabled

1.3.1143 DFB[0..0]_SEMA

DFB Semaphore Register

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_SEMA: 0x4000C790

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	W:000			NA:0	R/W:000		
HW Access	NA	R			NA	R		
Retention	NA	NONRET			NA	NONRET		
Name	RSVD	SEMA_MASK			RSVD	SEMA		

This register controls the DFB Semaphore register. These bits are used to pass semaphores between the DFB Controller and the System SW. Their use and purpose is user defined. A read to this register returns what was last written by either System SW or the DFB Controller.

Bits	Name	Description
6:4	SEMA_MASK[2:0]	These bits are used to mask writes to bits 2-0. They are write-only. If bit 4 is a 1 then the value on bit 0 will be written to SEM0, otherwise SEM0 will not be altered. Likewise for MASK1 and SEM1, and MASK2 and SEM2.
2:0	SEMA[2:0]	These bits are used to pass semaphores between the DFB Controller and the System SW. Their definition is user defined. There is no HW implementing an arbitration methodology should both the System and Control access the same SEM bit at the same time. Coherency of the SEM bits is the responsibility of the SW running on the Controller and the System CPU. If the same SEM bit is written by the Controller and the System in the exact same cycle (a collision), the System write takes precedence over the Controller. In this manner, each of the 3 bits are treated individually.

1.3.1144 DFB[0..0]_DSI_CTRL

DFB Global Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_DSI_CTRL: 0x4000C794

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		R/W:00	
HW Access	NA				R		R	
Retention	NA				RET		RET	
Name	RSVD				GBL2_OUT		GBL1_OUT	

This register controls what internal signals are mapped to the two primary output global signals dfb_globalo1 and dfb_globalo2. A read of this register produces the last value written to this register. These two outputs are registered (pclk rising) just before leaving the block - giving them a 1 cycle delay and a full clock cycle to propagate to their DSI destinations.

Bits	Name	Description
3:2	GBL2_OUT[1:0]	These bits are used to control what internal signals are mapped to the primary output signal dfb_globalo2.
		See Table 1-745.
1:0	GBL1_OUT[1:0]	These bits are used to control what internal signals are mapped to the primary output signal dfb_globalo1.
		See Table 1-744.

Table 1-744. Bit field encoding: global_output_1_encoding_bits_enum

Value	Name	Description
2'b00	DFB_RUN	DFB RUN Bit. This is the same bit as the RUN bit in the DFB0_CR register.
2'b01	SEM0	Semaphore Bit 0. This is the same signal described in the DFB0_SEMA CSR.
2'b10	SEM1	Semaphore Bit 1. This is the same signal described in the DFB0_SEMA CSR.
2'b11	DFB_INTR	DFB Interrupt. This is the same signal as the primary dfb_intr output signal.

Table 1-745. Bit field encoding: global_output_2_encoding_bits_enum

Value	Name	Description
2'b00	SEM2	Semaphore Bit 2. This is the same signal described in the DFB0_SEMA CSR.
2'b01	DPSIGN	Datapath Sign. This signal asserts anytime the output of the ALU in the Datapath unit is negative. It will remain high for each cycle this condition is true.
2'b10	DPTHREASH	Datapath Threshold Crossed. This signal asserts anytime the threshold of 0 is crossed in the ALU when one of the following instructions is executing: TDECA, TSUBA, TSUBB, TADDABSA, TADDABSB. It will remain high for each cycle this condition is true.
2'b11	DPEQ	Datapath ALU=0. This signal asserts high when the output of the ALU in the Datapath unit equals 0 and one of the following ALU commands is executing: TDECA, TSUBA, TSUBB, TADDABSA, TADDABSB. It will remain high for each cycle this condition is true.

1.3.1145 DFB[0..0]_INT_CTRL

DFB Interrupt Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_INT_CTRL: 0x4000C798

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			SEMA2_EN	SEMA1_EN	SEMA0_EN	HOLDB_EN	HOLDA_EN

This register allows control of what events generate an interrupt. Each of the events enabled by the bits in this register are ORed together to produce the dfb_intr signal. A read to this register returns what was last written. System SW should see that a semaphore is never configured as both a DMA request and an interrupt (see DMA_CTRL).

Bits	Name	Description
4	SEMA2_EN	If this bit is set high, an interrupt is generated each time a 1 is written into the semaphore register bit 2. See Table 1-747.
3	SEMA1_EN	If this bit is set high, an interrupt is generated each time a 1 is written into the semaphore register bit 1. See Table 1-747.
2	SEMA0_EN	If this bit is set high, an interrupt is generated each time a 1 is written into the semaphore register bit 0. See Table 1-747.
1	HOLDB_EN	If this bit is set high, an interrupt is generated each time new valid data is written into the output Holding register B. See Table 1-746.
0	HOLDA_EN	If this bit is set high, an interrupt is generated each time new valid data is written into the output Holding register A. See Table 1-746.

Table 1-746. Bit field encoding: enable_holding_reg_bit_enum

Value	Name	Description
1'b1	ENABLE_HOLDING_IRQ_EN	Interrupt is generated each time new valid data is written inot the output Holding register.
1'b0	ENABLE_HOLDING_IRQ_DIS	Holding register interrupt masked.

Table 1-747. Bit field encoding: enable_semaphore_bit_enum

Value	Name	Description
1'b1	ENABLE_SEMAPHORE_IRQ_EN	Interrupt is generated each time a 1 is written to the semaphore register.
1'b0	ENABLE_SEMAPHORE_IRQ_DIS	Semaphore register interrupt masked.

1.3.1146 DFB[0..0]_DMA_CTRL

DFB DMAREQ Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_DMA_CTRL: 0x4000C79C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:00		R/W:00	
HW Access	NA				R		R	
Retention	NA				RET		RET	
Name	RSVD				DMAREQ2		DMAREQ1	

This register allows control of what events generate DMAREQ events. Each field allows the user to configure what event drives each of the two DMAREQ primary output signals. Note that if a semaphore is configured as the DMAREQ the HW automatically clears the appropriate semaphore register after one pclk cycle - creating a single cycle pulse on the dmareq output as is required. Otherwise, the semaphores are sticky. If a Holding register is programmed as a DMAREQ, the DMAREQ is level sensed, instead of a pulse. The DMAREQ in this case will stay asserted until the Holding register is read. Level sensed is the preferred method of PHUB even though a strobe will work. System SW should see that a semaphore is never configured as both a DMA request and an interrupt (see INT_CTRL). A read of this register returns the last value written.

Bits	Name	Description
3:2	DMAREQ2[1:0]	The value in these two bits selects which event drives dma_req2. See Table 1-749.
1:0	DMAREQ1[1:0]	The value in these two bits selects which event drives dma_req1. See Table 1-748.

Table 1-748. Bit field encoding: dma_req_1_source_bits_enum

Value	Name	Description
2'b00	DMAREQ1_DISABLED	Disabled
2'b01	DMAREQ1_HOLDING_REG_A	New data in Holding Register A.
2'b10	DMAREQ1_SEMAPHORE_0	Semaphore 0.
2'b11	DMAREQ1_SEMAPHORE_1	Semaphore 1.

Table 1-749. Bit field encoding: dma_req_2_source_bits_enum

Value	Name	Description
2'b00	DMAREQ2_DISABLED	Disabled
2'b01	DMAREQ2_HOLDING_REG_B	New data in Holding Register B.
2'b10	DMAREQ2_SEMAPHORE_0	Semaphore 0.
2'b11	DMAREQ2_SEMAPHORE_1	Semaphore 1.

1.3.1147 DFB[0..0]_STAGEA

DFB Low Byte Staging Register A

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_STAGEA: 0x4000C7A0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGA_LOW							

This is the low byte of the Streaming input Staging Register - Port A. If the Staging A Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 15:8 instead. Although the Staging A/B registers are shown here as 3 byte-wide registers, it is primarily intended that they be treated as 24-bit registers at a 32-bit offset. Due to the architecture of the DFB, any value written to the Staging A or B registers that is less than 24 bits in size must be msb aligned. For example, a 16-bit value written to the Staging A register must be written to STAGExM and STAGExH with STAGEx set to 0. The Staging registers support byte and half-word accesses as well. However, if byte and half-word accesses are used then the Key Coherency Byte feature must be used. Also see the COHER register description below. In some use models it is desirous to write 16-bit values on bus bits 15:0 and have them actually writing to bits 23:8 of the register. A System SW convenience feature to accomplish this is provided. If the Data Alignment bit for these registers is set in the DALIGN register the byte written is shifted up (left) to the next byte position. This is only true of the two lower bytes. READ: AHB: What was last written. The DFB Controller reads this register (and the other 2 bytes) by asserting busrd and setting the low-order ACU RAM address bit low. WRITE: Writes the low byte of the input Staging Register for Port A or the middle byte if the Data Alignment bit is set in the DALIGN register.

Bits	Name	Description
7:0	STGA_LOW[7:0]	A write to this register sets the low byte of the input Staging Register for Port A.

1.3.1148 DFB[0..0]_STAGEAM

DFB Middle Byte Staging Register A

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_STAGEAM: 0x4000C7A1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGA_MID							

This is the middle byte of the Streaming input Staging Register - Port A. If the Staging A Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 23:16 instead. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGA_MID[7:0]	A write to this register sets the middle byte of the input Staging Register for Port A.

1.3.1149 DFB[0..0]_STAGEAH

DFB High Byte Staging Register A

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_STAGEAH: 0x4000C7A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGA_HIGH							

This is the high byte of the Streaming input Staging Register - Port A. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGA_HIGH[7:0]	A write to this register sets the high byte of the input Staging Register for Port A.

1.3.1150 DFB[0..0]_STAGEB

DFB Low Byte Staging Register B

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_STAGEB: 0x4000C7A4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGB_LOW							

This is the low byte of the Streaming input Staging Register - Port B. If the Staging B Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 15:8 instead. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGB_LOW[7:0]	A write to this register sets the low byte of the input Staging Register for Port B.

1.3.1151 DFB[0..0]_STAGEBM

DFB Middle Byte Staging Register B

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_STAGEBM: 0x4000C7A5

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGB_MID							

This is the middle byte of the Streaming input Staging Register - Port B. If the Staging B Data Alignment bit is set in the DALIGN register then data written to this address will be written into bits 23:16 instead. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGB_MID[7:0]	A write to this register sets the middle byte of the input Staging Register for Port B.

1.3.1152 DFB[0..0]_STAGEBH

DFB High Byte Staging Register B

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_STAGEBH: 0x4000C7A6

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	STGB_HIGH							

This is the high byte of the Streaming input Staging Register - Port B. See usage notes in STAGEA register description above.

Bits	Name	Description
7:0	STGB_HIGH[7:0]	A write to this register sets the high byte of the input Staging Register for Port B.

1.3.1153 DFB[0..0]_HOLDA

DFB Low Byte Holding Register A

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_HOLDA: 0x4000C7A8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_LOW							

This is the low byte of the output Holding Register - Port A. If the Holding A Data Alignment bit is set in the DALIGN register then data read from this address will be bits 15:8 instead. Although the Holding A/B registers are shown here as 3 byte-wide registers, it is primarily intended that they be treated as 24-bit registers at a 32-bit offset. Due to the architecture of the DFB, any value read from the Holding A or B registers will be msb aligned unless shifted otherwise by the Datapath shifter. For example, if the resultant output samples are 16-bit values, a read of a Holding register will produce that data on bits 23:8, or HOLDxH and HOLDxM. The Holding registers support byte and half-word accesses as well. However, if byte and half-word accesses are used then the Key Coherency Byte feature must be used. Also see the COHER register description below. In some use models it is desirous to read 16-bit values on bus bits 15:0 and have them actually source from bits 23:8 of the register. A System SW convenience feature to accomplish this is provided. If the Data Alignment bit for these registers is set in the DALIGN register the byte read is shifted down (right) to the next byte position. This is only true of the two upper bytes. Also as a System SW convenience, reads of the Holding registers are sign extended up to bit 31 of the bus even though the top byte is not documented or implemented as a real register. If the DFB is configured (see INT_CTRL) to generate an interrupt based on valid data in the Holding register, the interrupt status bit in the SR register will be cleared when any portion (byte, 16-bit or full 32-bit read) of the Holding register is read, by the CPU or the DMA Controller. READ: What was last written by the DFB Controller. WRITE: Read-only by AHB, DFB Controller writes to this register (including the other 2 bytes) with a buswr command and the low-order ACU RAM address bit set low.

Bits	Name	Description
7:0	HOLDA_LOW[7:0]	Low byte of the output Holding Register, Port A.

1.3.1154 DFB[0..0]_HOLDAM

DFB Middle Byte Holding Register A

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_HOLDAM: 0x4000C7A9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_MID							

This is the middle byte of the output Holding Register - Port A. If the Holding A Data Alignment bit is set in the DALIGN register then data read from this address will be bits 23:16 instead. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDA_MID[7:0]	Middle byte of the output Holding Register, Port A.

1.3.1155 DFB[0..0]_HOLDAH

DFB High Byte Holding Register A

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_HOLDAH: 0x4000C7AA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_HIGH							

This is the high byte of the output Holding Register - Port A. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDA_HIGH[7:0]	High byte of the output Holding Register, Port A.

1.3.1156 DFB[0..0]_HOLDAS

DFB Holding Register A Sign Extension

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_HOLDAS: 0x4000C7AB

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDA_SIGNEXT							

* This is a pseudo register. There are no FFs or even an address decode for this pseudo register. If read or written as a byte it acts the same as all other unused byte addresses in the block's address space - writes are ignored and reads produce 0 on the bus. However, if HOLDA is read as a 32-bit value or HOLDAH is read as a 16-bit value, the sign is extended onto this byte lane. This pseudo register definition is here simply to document this sign extension functionality. See usage notes in HOLDA register description above. READ: Always 0 if read as a byte. Always the sign extension if HOLDA is read as a 32-bit value or HOLDAH is read as a 16-bit value. WRITE: Ignored.

Bits	Name	Description
7:0	HOLDA_SIGNEXT[7:0]	Output Holding Register Sign Extension, Port A.

1.3.1157 DFB[0..0]_HOLDB

DFB Low Byte Holding Register B

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_HOLDB: 0x4000C7AC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	NONRET							
Name	HOLDB_LOW							

This is the low byte of the output Holding Register - Port B. If the Holding B Data Alignment bit is set in the DALIGN register then data read from this address will be bits 15:8 instead. See usage notes in HOLDA register description above.

Bits	Name	Description
7:0	HOLDB_LOW[7:0]	Low byte of the output Holding Register, Port B.

1.3.1158 DFB[0..0]_HOLDBM

DFB Middle Byte Holding Register B

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

DFB0_HOLDBM: 0x4000C7AD

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000

Always the sign extension if HOLDB is read as a 32-bit value or HOLDBH is read as a 16-bit value. WRITE: Ignored.

Bits	Name	Description
7:0	HOLDB_SIGNEXT[7:0]	Output Holding Register Sign Extension, Port B.

1.3.1161 DFB[0..0]_COHER

DFB Coherency Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_COHER: 0x4000C7B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:10		R/W:10		R/W:10		R/W:10	
HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	holdb_key		holda_key		stgb_key		stga_key	

The 4 2-bit fields of this register are used to select which of the 3 bytes of each of the STAGEA, STAGEB, HOLDA and HOLDB will be used as the Key Coherency Byte. Coherency refers to the HW added to this block to protect against malfunctions of the block in cases where register fields are wider than the bus access, leaving intervals in time when fields are partially written/read (incoherent). The Key Coherency Byte is the SW's way of telling the HW which byte of the field will be written/read last when an update to the field is desired. When the Key byte is written/read, the field is flagged coherent. If any other byte is written/read, the field is flagged incoherent.

Bits	Name	Description
7:6	holdb_key[1:0]	Sets the Key Coherency Byte of the Holding B register
		See Table 1-751.
5:4	holda_key[1:0]	Sets the Key Coherency Byte of the Holding A register
		See Table 1-750.
3:2	stgb_key[1:0]	Sets the Key Coherency Byte of the Staging B register
		See Table 1-753.
1:0	stga_key[1:0]	Sets the Key Coherency Byte of the Staging A register
		See Table 1-752.

Table 1-750. Bit field encoding: holda_key_enum

Value	Name	Description
2'b00	HOLDA_KEY_LOW	Key Byte is low byte.
2'b01	HOLDA_KEY_MID	Key Byte is med byte.
2'b10	HOLDA_KEY_HIGH	Key Byte is high byte.

Table 1-751. Bit field encoding: holdb_key_enum

Value	Name	Description
2'b00	HOLDB_KEY_LOW	Key Byte is low byte.
2'b01	HOLDB_KEY_MID	Key Byte is med byte.
2'b10	HOLDB_KEY_HIGH	Key Byte is high byte.

2'b10	STGB_KEY_HIGH	Key Byte is high byte.

1.3.1162 DFB[0..0]_DALIGN

DFB Data Alignment Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DFB0_DALIGN: 0x4000C7B4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				holdb_dalign	holda_dalign	stgb_dalign	stga_dalign

These bits when set high causes an 8-bit shift in the data to all access of the corresponding Staging and Holding registers. The purpose of this feature is to allow 9 to 16 bit input and output samples to travel as 16-bit values on the AHB bus. Because the DFB datapath is inherently msb aligned, it is convenient to the System SW to align values on bits 23:8 of the Staging and Holding register to bits 15:0 of the bus. A read of this register produces the last value written to this register.

Bits	Name	Description
3	holdb_dalign	Shifts the read right by a byte.
		See Table 1-755.
2	holda_dalign	Shifts the read right by a byte.
		See Table 1-754.
1	stgb_dalign	Shifts the write left by a byte.
		See Table 1-757.
0	stga_dalign	Shifts the write left by a byte.
		See Table 1-756.

Table 1-754. Bit field encoding: holda_dalign_enum

Value	Name	Description
1'b0	HOLDA_DALIGN_LOW	Reads normally.
1'b1	HOLDA_DALIGN_HIGH	Reads shifted right by 8-bits.

Table 1-755. Bit field encoding: holdb_dalign_enum

Value	Name	Description
1'b0	HOLDB_DALIGN_LOW	Reads normally.
1'b1	HOLDB_DALIGN_HIGH	Reads shifted right by 8-bits.

Table 1-756. Bit field encoding: stga_dalign_enum

Value	Name	Description
1'b0	STGA_DALIGN_LOW	Writes normally.
1'b1	STGA_DALIGN_HIGH	Writes shifted left by 8-bits.

Table 1-757. Bit field encoding: stgb_dalign_enum

Value	Name	Description
1'b0	STGB_DALIGN_LOW	Writes normally.
1'b1	STGB_DALIGN_HIGH	Writes shifted left by 8-bits.

Name	F1_CK_INV	F0_CK_INV	FIFO_FAST	FIFO_CAP	FIFO_EDGE	FIFO_ASYNC	EXT_CRCPRS	WRK16_CONCAT

Datapath FIFO and register access configuration control

Bits	Name	Description
7	F1_CK_INV	FIFO Clock Invert. When this bit is set, the polarity of the clock for the given FIFO will be inverted, with respect to the polarity of the selected Datapath clock. See Table 1-790.
6	F0_CK_INV	FIFO Clock Invert. When this bit is set, the polarity of the clock for the given FIFO will be inverted, with respect to the polarity of the selected Datapath clock. See Table 1-790.
5	FIFO_FAST	FIFO Fast Mode. When this bit is set, the FIFO write logic is clocked by the application bus clock. Lowers the latency of capture timing, at the expense of additional power. See Table 1-792.
4	FIFO_CAP	FIFO Software Capture Mode. When this bit is set, a read of A0 or A1 triggers a capture into F0 or F1 respectively. This function follows the chaining configuration. All accumulators in the chain from a given block to the MS block in the chain are captured. Captured data may be read immediately from the FIFO. Only applies to FIFOs configured in output mode. See Table 1-789.

1.3.1185   B[0..3]_P[0..7]_U[0..1]_CFG16 (continued)

3	FIFO_EDGE	Edge/level sensitive FIFO write control (Fx_LD). Only applies to FIFO configured in output mode
		See Table 1-791.
2	FIFO_ASYNC	Asynchronous FIFO clocking support
		See Table 1-788.
1	EXT_CRCPRS	External CRC/PRS mode
		See Table 1-787.
0	WRK16_CONCAT	Datapath register access mode
		See Table 1-793.

Table 1-787. Bit field encoding: EXT_CRCPRS_ENUM

Value	Name	Description
1'b0	INTERNAL	Internal CRC/PRS routing
1'b1	EXTERNAL	External CRC/PRS routing

Table 1-788. Bit field encoding: FIFO_ASYNC_ENUM

Value	Name	Description
1'b0	DISABLED	FIFO clocks are synchronous
1'b1	ENABLED	FIFO clocks are asynchronous

Table 1-789. Bit field encoding: FIFO_CAP_ENUM

Value	Name	Description
1'b0	DISABLED	FIFO capture is disabled.
1'b1	ENABLED	FIFO capture is enabled (FIFO must be in output mode). A read of A0 or A1 will write into F0 or F1.

Table 1-790. Bit field encoding: FIFO_CK_INV_ENUM

Value	Name	Description
1'b0	NORMAL	FIFO clock is the same polarity as the Datapath clock.
1'b1	INVERTED	FIFO clock is inverted with respect to the Datapath clock.

Table 1-791. Bit field encoding: FIFO_EDGE_ENUM

Value	Name	Description
1'b0	LEVEL	FIFO write from accumulators/ALU is level sensitive. FIFO write occurs on a clock edge whenever the write control is sampled high on that edge.
1'b1	EDGE	FIFO write from accumulators/ALU is edge sensitive. FIFO write occurs on a clock edge folloing a 0 to 1 transition on the write control. The write control must be negated for at least one full cycle of the FIFO clock for a subsequent transition to be detected.

Table 1-792. Bit field encoding: FIFO_FAST_ENUM

Value	Name	Description
1'b0	DISABLED	FIFO is clocked with selected Datapath clock.
1'b1	ENABLED	FIFO is clocked with application bus clock. Master and quadrant bus clock gating must be enabled.

Table 1-793. Bit field encoding: WRK16_SEL_ENUM

Value	Name	Description
1'b0	DEFAULT	16-bit default access mode: selects registers in two consecutive UDBs in chaining order
1'b1	CONCATENATE	16-bit concat access mode: selects concatenated registers in a single UDB

HW Access	NA			R	R	R	R	R
Retention	NA			RET	RET	RET	RET	RET
Name	RSVD			FIFO_ADD_SYNC	NC1	NC0	F1_DYN	F0_DYN

Datapath FIFO control

Bits	Name	Description
4	FIFO_ADD_SYNC	Adds an additional sync flip-flop to FIFO block status.
		See Table 1-794.
3	NC1	Spare register bit
2	NC0	Spare register bit
1	F1_DYN	When this bit is set, the associated FIFO configuration may be dynamically controlled.
		See Table 1-795.
0	F0_DYN	When this bit is set, the associated FIFO configuration may be dynamically controlled.
		See Table 1-795.

Table 1-794. Bit field encoding: FIFO_ADD_SYNC_ENUM

Value	Name	Description
1'b0	DISABLED	Compatible Mode: FIFO block status sync configuration is 'none' (FIFO_ASYNC = 0) and 1 sync flip-flop (FIFO_ASYNC = 1)

1.3.1186   **B[0..3]_P[0..7]_U[0..1]_CFG17** (continued)

Table 1-794. Bit field encoding: FIFO_ADD_SYNC_ENUM

1'b1	ENABLED	Add Sync Mode: FIFO block status sync configuration 1 sync flip-flop (FIFO_ASYNC = 0) and 2 sync flip-flops (FIFO_ASYNC = 1)

Table 1-795. Bit field encoding: FIFO_DYN_ENUM

Value	Name	Description
1'b0	STATIC	Default. FIFO direction is static and controlled by the associated Fx_INSEL bits (CFG15).
1'b1	DYNAMIC	The associated FIFO direction is dynamically controlled by the associated 'dx_load' Datapath input signal. When the 'dx_load' signal is '0', the access is internal, where the FIFO is both a source for the Datapath, and a destination for the Datapath (destination path from Fx_INSEL bits). When the 'dx_load' signal is '1', the access is external, where the CPU can both write and read the FIFO. When dynamic mode is activated, the dx_load signals are disabled for use as Data Register load signals.

Similar to Sync Mode, the control bit is resampled, then driven into the routing for a duration of 1 SC clock period. In addition, the control bit accessible by the CPU is reset at the end of the pulse period. The control bit can be polled for feedback with regard to this timing.

Status Register input mode selection

Bits	Name	Description
7:0	STAT_MD[7:0]	Mode selection for each bit of the status register. A '0' is transparent mode, where internal routing is read directly by CPU firmware. A '1' is sticky-clear-on-read mode, where once the given bit is set, it will stay set until the CPU reads the bit.

SC block configuration control

Bits	Name	Description
4	SC_EXT_RES	Control register external reset operation. This bit supports autonomous usage of the control register, where a routed reset should clear the writable input registers. By default this is off because the CPU writable register can be cleared in firmware. In other usage models, such as DMA data writing, an asynchronous routed reset may be needed. See Table 1-797.
3	SC_SYNC_MD	SC Sync Mode - controls when the status register operates as a 4-bit double synchronizer module See Table 1-799.
2	SC_INT_MD	SC Interrupt Mode - controls when the UDB driving an interrupt generated from the masked OR reduction of status bits 6 to 0 See Table 1-798.
1:0	SC_OUT_CTL[1:0]	Selects the output source for the Status and Control routing connections See Table 1-796.

1.3.1191 B[0..3]_P[0..7]_U[0..1]_CFG22 (continued)

Table 1-796. Bit field encoding: OUT_CTL_ENUM

Value	Name	Description
2'b00	CONTROL	Control out, 8-bits of control are driven to the routing connections
2'b01	PARALLEL	Datapath parallel output, 8-bits of datapath parallel output data are driven to the routing connections
2'b10	COUNTER	Counter out, 7-bits of count and 1 bit (MSB) of terminal count are driven to the routing connections
2'b11	RESERVED	Reserved

Table 1-797. Bit field encoding: SC_EXT_RES_ENUM

Value	Name	Description
1'b0	DISABLED	When a routed reset is applied to the control register, only embedded state (sampling registers) are cleared
1'b1	ENABLED	When a routed reset is applied to the control register, all state is cleared, including the CPU writable control bits.

Table 1-798. Bit field encoding: SC_INT_MD_ENUM

Value	Name	Description
1'b0	NORMAL	Normal Mode - Routing connection sc_io[3] is a normal input to the status register
1'b1	INT_MODE	Interrupt Mode - Routing connection sc_io[3] operates as the UDB interrupt output

Table 1-799. Bit field encoding: SC_SYNC_MD_ENUM

Value	Name	Description
1'b0	NORMAL	Normal Mode - Status register operation
1'b1	SYNC_MODE	Sync Mode - Routing inputs sc_in[3:0] are the 4 sync inputs, and connections sc_io[3:0] operate as the sync outputs

PLD1 Clock and Reset control. Note: In alternate reset mode (ALT RES = 1), The PLD0 routed reset selection controls both PLD0 and PLD1, therefore the RC_SEL bits for PLD1 are not used.

Bits	Name	Description
7	RC_RES_SEL1	Configures the routed reset for the associated UDB component block. The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES = '0' - This bit is not used. When ALT RES = '1' - The bits {RC_SEL1,RC_SEL0_OR_FRES} select the RC routing for routed reset control according to the following: 00 : rc_in [0] 01 : rc_in [1] 10 : rc_in [2] 11 : rc_in [3]
6	RC_RES_SEL0_OR_FRES	Configures the routed or firmware reset for the associated UDB component block. The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES = '0' - This bit is a firmware reset. When ALT RES = '1' - The bits {RC_SEL1,RC_SEL0_OR_FRES} select the RC routing for routed reset control according to the following: 00 : rc_in [0] 01 : rc_in [1] 10 : rc_in [2] 11 : rc_in [3]
5	RC_INV	Optionally inverts the clock selection for the associated UDB component block.
See Table 1-812.

1.3.1194   B[0..3]_P[0..7]_U[0..1]_CFG25 (continued)

4	RC_EN_INV	Optionally inverts the clock enable selection for the associated UDB component blocks.
		See Table 1-809.
3:2	RC_EN_MODE[1:0]	Selects the operating mode for the clock to the associated UDB component block.
		See Table 1-810.
1:0	RC_EN_SEL[1:0]	Selects channel route for enable control to the associated UDB component block
		See Table 1-811.

Datapath Clock and Reset control

Bits	Name	Description
7	RC_RES_SEL1	Configures the routed reset for the associated UDB component block. The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES = '0' - This bit is not used. When ALT RES = '1' - The bits {RC_SEL1,RC_SEL0_OR_FRES} select the RC routing for routed reset control according to the following: 00 : rc_in [0] 01 : rc_in [1] 10 : rc_in [2] 11 : rc_in [3]
6	RC_RES_SEL0_OR_FRES	Configures the routed or firmware reset for the associated UDB component block. The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES = '0' - This bit is a firmware reset. When ALT RES = '1' - The bits {RC_SEL1,RC_SEL0_OR_FRES} select the RC routing for routed reset control according to the following: 00 : rc_in [0] 01 : rc_in [1] 10 : rc_in [2] 11 : rc_in [3]
5	RC_INV	Optionally inverts the clock selection for the associated UDB component block. See Table 1-816.
4	RC_EN_INV	Optionally inverts the clock enable selection for the associated UDB component blocks. See Table 1-813.

1.3.1195   B[0..3]_P[0..7]_U[0..1]_CFG26 (continued)

3:2	RC_EN_MODE[1:0]	Selects the operating mode for the clock to the associated UDB component block.
		See Table 1-814.
1:0	RC_EN_SEL[1:0]	Selects channel route for enable control to the associated UDB component block
		See Table 1-815.

Name	SC_RES_POL	DP_RES_POL	RSVD	GUDB_WR	EN_RES_CNTCTL	RES_POL	RES_SEL	

Reset control

Bits	Name	Description
7	SC_RES_POL	Only valid when ALT RES (CFG31) is '1'. This bit controls the polarity of the selected SC routed reset. See Table 1-828.
6	DP_RES_POL	Only valid when ALT RES (CFG31) is '1'. This bit controls the polarity of the selected Datapath routed reset. See Table 1-823.
4	GUDB_WR	Enable global write operation for the configuration and working registers in this UDB. When this bit is set, the UDB ID select decoding is bypassed. See Table 1-825.
3	EN_RES_CNTCTL	This bit gates the routed reset to the counter/control register. By default, the operation is compatible, i.e., it only applies to the counter. However, if the updated control regisiter modes are used (sync mode, pulse mode, or the ext res bit) then the routed reset applies to the control register also. See Table 1-824.

1.3.1199   B[0..3]_P[0..7]_U[0..1]_CFG30 (continued)

2	RES_POL	The meaning of this bit depends on the value of the ALT RES bit in CFG31. When ALT RES is '0' (compatible mode), this bit sets the polarity of the routed reset. When ALT RES is '1', this bit is unused.
		See Table 1-826.
1:0	RES_SEL[1:0]	The meaning of this bit depends on the value of ALT RES (CFG31). When ALT RES is '0' (compatible mode), this 2 bit field selects the RC routing input for the compatible reset scheme. When the ALT RES bit is '1', these bits are not used.
		See Table 1-827.

Table 1-823. Bit field encoding: RC_DP_RES_POL_ENUM

Value	Name	Description
1'b0	TRUE	Routed reset to the Datapath block is true polarity.
1'b1	INVERTED	Routed reset to the Datapath block is inverted polarity.

Table 1-824. Bit field encoding: RC_EN_RES_CNTCTL_ENUM

Value	Name	Description
1'b0	DISABLE	Routed reset is not applied to counter/control register
1'b1	ENABLE	Routed reset is applied to the counter/control register

Table 1-825. Bit field encoding: RC_GUDB_WR_ENUM

Value	Name	Description
1'b0	DISABLE	Global UDB configuration/working register write is disabled
1'b1	ENABLE	Global UDB configuration/working register write is enabled

Table 1-826. Bit field encoding: RC_RES_POL_ENUM

Value	Name	Description

Name	PLD1_RES _POL	PLD0_RES _POL	EXT_CK_SEL		EN_RES_D P	EN_RES_S TAT	EXT_SYNC	ALT_RES

Reset control

Bits	Name	Description
7	PLD1_RES_POL	Not connected. NOTE: There is only one routed reset available to both PLDs in the UDB. When ALT RES is '1', PLD0 RES SEL controls the polarity of the routed reset for both PLDs. See Table 1-835.
6	PLD0_RES_POL	The meaning of this bit depends on the value of ALT RES. When ALT RES (CFG31) is '1', this bit controls the polarity of the selected PLD0 routed reset. NOTE: There is only one routed reset available in the PLD block for both PLDs, therefore this bit controls the reset polarity to both PLD0 and PLD1. When ALT RES is '0' this bit is not used. See Table 1-834.
5:4	EXT_CK_SEL[1:0]	External clock selection See Table 1-832.
3	EN_RES_DP	Only valid when ALT RES (CFG31) is '1'. This bit gates the routed reset to the Datapath block. See Table 1-830.

1.3.1200   B[0..3]_P[0..7]_U[0..1]_CFG31 (continued)

2	EN_RES_STAT	Only valid when ALT RES (CFG31) is '1'. This bit gates the routed reset to the status register.
		See Table 1-831.
1	EXT_SYNC	Enable synchronization of selected external clock
		See Table 1-833.
0	ALT_RES	This bit toggles between two reset configurations. When this bit is '0', one routed reset is shared by all components in this UDB (compatible mode). When this bit is a 1, each block can select a unique routed reset from the available RC inputs.;
		See Table 1-829.

Table 1-829. Bit field encoding: RC_ALT_RES_ENUM

Value	Name	Description
1'b0	COMPATIBLE	All UDB blocks share a common routed reset.
1'b1	ALTERNAT	Each UDB component block can select and control it's individual routed reset.

Table 1-830. Bit field encoding: RC_EN_RES_DP_ENUM

Value	Name	Description
1'b0	DISABLE	Routed reset to the Datapath block is gated off.
1'b1	ENABLE	Routed reset to the Datapath block is on. ALT RES must be '1' and routed reset must be selected in CFG26

Table 1-831. Bit field encoding: RC_EN_RES_STAT_ENUM

Value	Name	Description
1'b0	NEGATED	Status register routed reset is gated off
1'b1	ASSERTED	Status register routed reset is on

Table 1-832. Bit field encoding: RC_EXT_CK_SEL_ENUM

Value	Name	Description
2'b00	RC_IN0	rc_in[0]
2'b01	RC_IN1	rc_in[1]
2'b10	RC_IN2	rc_in[2]
2'b11	RC_IN3	rc_in[3]

Table 1-833. Bit field encoding: RC_EXT_SYNC_ENUM

Value	Name	Description
1'b0	DISABLE	Selected external clock input is not synchronized
1'b1	ENABLE	Selected external clock input is synchronized

Table 1-834. Bit field encoding: RC_PLD0_RES_POL_ENUM

Value	Name	Description
1'b0	TRUE	Routed reset to the PLD0/PLD1 block is true polarity.
1'b1	INVERTED	Routed reset to the PLD0/PLD1 block is inverted polarity.

Table 1-835. Bit field encoding: RC_PLD1_RES_POL_ENUM

Value	Name	Description
1'b0	TRUE	NU
1'b1	INVERTED	NU

Retention	NA	NA	NA	NA	RET	RET	RET	RET
Name	RSVD	RSVD	RSVD	RSVD	GLBL_WR	DPARAM_TM	ROUTE_ENABLE	DIS_COR

Bank Control Register

Bits	Name	Description
3	GLBL_WR	Global Write Test Mode: The purpose of this bit is to accelerate configuration and working register writing for test purposes. When this bit is set, the bank is in global write mode. In this mode a set of UDBs or UDB channels are selected for writing in parallel based on the setting of the GUDB WR bits and GCH WR bits in the individual UDB. See Table 1-861.
2	DPARAM_TM	DPARAM Test Mode: The DP RAM (s8dparam_ram16x8) has two read ports, one connectred to the system bus (for configuration of the RAM), and one port that drives the DP control bits. When this bit is set, the DP RAM control port is connected to the system bus for reading (the system bus read port is tri-stated) See Table 1-860.
1	ROUTE_ENABLE	Route Enable: When this bit is a 0, all routing drivers are gated off to drive '0'. This results in nets either at 'Z' or '0' state and prevents driver conflicts with random configuration RAM on POR. This bit also controls gating of buffer inputs to prevent high current states in the case of 'Z' nets. After configuration, this bit may be enabled. See Table 1-862.
0	DIS_COR	Disable Clear On Read: The status registers have an automatic clear on read function to maintain firmware synchronization with UDB processing. When the system is stopped in debug mode, this bit can be used to prevent the statu from clearing on a debug read. It also prevents a read pop from the FIFO blocks. Only the top of FIFO can be read when this bit is set. See Table 1-859.

Table 1-859. Bit field encoding: COR_ENUM

Value	Name	Description
1'b0	ENABLE	Status register clear on read enabled. (default)
1'b1	DISABLE	Status register clear on read disabled.

Table 1-860. Bit field encoding: DPARAM_TM_ENUM

Value	Name	Description
1'b0	DISABLE	DPARAM test mode is disabled. (default)
1'b1	ENABLE	DPARAM test mode is enabled.

1.3.1256   **BCTL[0..3]_BANK_CTL** (continued)

Table 1-861. Bit field encoding: GLBL_WR_ENUM

Value	Name	Description
1'b0	DISABLE	Global Write Test Mode is disabled. (default)
1'b1	ENABLE	Global Write Test Mode enabled.

Table 1-862. Bit field encoding: ROUTE_ENABLE

Value	Name	Description
1'b0	DISABLE	Routing input drivers are gated off to '0' (default)
1'b1	ENABLE	Routing input drivers are enabled.

Table 1-863. Bit field encoding: USCAN_CLK_ENUM

Value	Name	Description
1'b0	DISABLE	UDB DSI scan clk is idle
1'b1	ENABLE	UDB DSI scan clk asserted for 1 clock pulse if USCAN_SE = 0 (capture mode) or for 32 clock pulses if USCAN_SE = 1 (shift mode). Register bit auto-clears after one clock.

Table 1-864. Bit field encoding: USCAN_RES_ENUM

Value	Name	Description
1'b0	DISABLE	RESET is not asserted to the UDB DSI scan registers.
1'b1	ENABLE	RESET is asserted to the UDB DSI scan registers.

Table 1-865. Bit field encoding: USCAN_SET_ENUM

Value	Name	Description
1'b0	DISABLE	SET is not asserted to the UDB DSI scan registers.
1'b1	ENABLE	SET is asserted to the UDB DSI scan registers.

Table 1-866. Bit field encoding: USCAN_SE_ENUM

Value	Name	Description
1'b0	DISABLE	UDB DSI scan chain is in capture mode.
1'b1	ENABLE	UDB DSI scan chain is in shift mode.

1.3.1258 BCTL[0..3]_BCLK_EN0

BCLK_EN

Reset: Reset Signals Listed Below

Register : Address

BCTL0_BCLK_EN0: 0x40015009   BCTL1_BCLK_EN0: 0x40015019

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0	R/W:0
HW Access	NA	R	R	R	R	R	R	R
Retention	NA	RET	RET	RET	RET	RET	RET	RET
Name	RSVD	NC0	WR_CFG_OPT	GLB_DSI_WR	DISABLE_ROUTE	GCH_WR_HI	GCH_WR_LO	BCEN

Bus Clock Enable Register

Bits	Name	Description
6	NC0	Spare register bit
5	WR_CFG_OPT	Select 1/2 clock cycle or full clock cycle generation for bus_last_strobe used in generating write strobes for latches within the UDB. Only one BCLK_ENx register per bank has an active bit. BCTL0_BCLK_EN0 controls this bit for Bank 0. BCTL1_BCLK_EN1 controls this bit for Bank 1. The WR_CFG_OPT bits in the other BCTLx_BCLK_ENy registers are not used. See Table 1-874.
4	GLB_DSI_WR	Enable global write operation for the DSI routing channels. When this bit is set, the DSI ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. Control is split top and bottom. BCTL0_BCLK_EN0 controls DSI blocks 0-3. BCTL0_BCLK_EN3 controls DSI blocks 4-7. BCTL1_BCLK_EN1 controls DSI blocks 8-9. BCTL1_BCLK_EN2 controls DSI blocks 12-13. The GLB_DSI_WR bits in the other BCTLx_BCLK_ENy registers are not used. See Table 1-872.
3	DISABLE_ROUTE	By default, when this bit is set to '0', the quadrant routing (for 2 channels in the quadrant) are enabled when the global route enable for the bank is set. However, when this bit is set to '1', the routing in the associated quadrant is disabled and is not enabled by the global route enable bit. The routing will remain in a benign state until it is subsequently configured and then enabled by clearing this bit. See Table 1-869.
2	GCH_WR_HI	Enable global write operation for the routing channel with the higher address in the associated quadrant. When enabled, the UDB ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. See Table 1-870.
1	GCH_WR_LO	Enable global write operation for the routing channel with the lower address in the associated quadrant. When enabled, the UDB ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. See Table 1-871.
0	BCEN	Bank Clock Enable Control See Table 1-868.

Reset Table

Reset Signal	Applicable Register Bit(s)
System reset for retention flops [reset_all_retention]	BCEN, GCH_WR_LO, GCH_WR_HI, DISABLE_ROUTE, GLB_DSI_WR, WR_CFG_OPT, NC0
Domain reset for non-retention flops [reset_all_nonretention]	SLEEP_TEST

Table 1-868. Bit field encoding: CLK_EN_ENUM

Value	Name	Description
1'b0	DISABLE	Digital Global clock is disabled.
1'b1	ENABLE	Digital Global clock is enabled.

Table 1-869. Bit field encoding: DIS_ROUTE

Value	Name	Description
1'b0	ENABLE	The routing in this quadrant can be enabled with the bank route enable bit. (default)
1'b1	DISABLE	The routing in this quadrant is disabled and held in a benign state.

Table 1-870. Bit field encoding: GCH_WR_HI

Value	Name	Description
1'b0	DISABLE	Global UDB channel configuration write for higher order address is disabled.
1'b1	ENABLE	Global UDB channel configuration write for higher order address is enabled.

Table 1-871. Bit field encoding: GCH_WR_LO

Value	Name	Description
1'b0	DISABLE	Global UDB channel configuration write for lower order address is disabled.
1'b1	ENABLE	Global UDB channel configuration write for lower order address is enabled.

Table 1-872. Bit field encoding: GLB_DSI_WR

Value	Name	Description
1'b0	DISABLE	Global DSI channel configuration write is disabled.
1'b1	ENABLE	Global DSI channel configuration write is enabled.

Table 1-873. Bit field encoding: SLEEP_TEST_ENUM

Value	Name	Description
1'b0	DISABLE	sleep_test is not asserted.
1'b1	ENABLE	sleep_test is asserted.

Table 1-874. Bit field encoding: WR_CFG_OPT_ENUM

Value	Name	Description
1'b0	FULL_CYCLE_STB	bus_last_strobe is generated for the full final bus_clk cycle of a bus transaction.
1'b1	HALF_CYCLE_STB	bus_last_strobe is generated during the last 1/2 clock cycle of a bus transaction on the negative edge of bus_clk.

Name	RSVD	NC0	WR_CFG_OPT	GLB_DSI_WR	DISABLE_ROUTE	GCH_WR_HI	GCH_WR_LO	BCEN

Bus Clock Enable Register

Bits	Name	Description
6	NC0	Spare register bit
5	WR_CFG_OPT	Select 1/2 clock cycle or full clock cycle generation for bus_last_strobe used in generating write strobes for latches within the UDB. Only one BCLK_ENx register per bank has an active bit. BCTL0_BCLK_EN0 controls this bit for Bank 0. BCTL1_BCLK_EN1 controls this bit for Bank 1. The WR_CFG_OPT bits in the other BCTLx_BCLK_ENy registers are not used. See Table 1-882.
4	GLB_DSI_WR	Enable global write operation for the DSI routing channels. When this bit is set, the DSI ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. Control is split top and bottom. BCTL0_BCLK_EN0 controls DSI blocks 0-3. BCTL0_BCLK_EN3 controls DSI blocks 4-7. BCTL1_BCLK_EN1 controls DSI blocks 8-9. BCTL1_BCLK_EN2 controls DSI blocks 12-13. The GLB_DSI_WR bits in the other BCTLx_BCLK_ENy registers are not used. See Table 1-880.
3	DISABLE_ROUTE	By default, when this bit is set to '0', the quadrant routing (for 2 channels in the quadrant) are enabled when the global route enable for the bank is set. However, when this bit is set to '1', the routing in the associated quadrant is disabled and is not enabled by the global route enable bit. The routing will remain in a benign state until it is subsequently configured and then enabled by clearing this bit. See Table 1-877.
2	GCH_WR_HI	Enable global write operation for the routing channel with the higher address in the associated quadrant. When enabled, the UDB ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. See Table 1-878.
1	GCH_WR_LO	Enable global write operation for the routing channel with the lower address in the associated quadrant. When enabled, the UDB ID select decoding is bypassed and therefore multiple channels can be written to simultaneously. This is designed to support test modes. See Table 1-879.

HW Access	R		R		R		R	
Retention	RET		RET		RET		RET	
Name	DCTRL3		DCTRL2		DCTRL1		DCTRL0	

This register is used to select between DMA requests (fixed function or udb).

Bits	Name	Description
7:6	DCTRL3[1:0]	DMA input type.
		See Table 1-900.
5:4	DCTRL2[1:0]	DMA input type.
		See Table 1-900.
3:2	DCTRL1[1:0]	DMA input type.
		See Table 1-900.
1:0	DCTRL0[1:0]	DMA input type.
		See Table 1-900.

Table 1-900. Bit field encoding: drq_enum

Value	Name	Description
2'b00	Fixed Function	Fixed Function DMA request.
2'b01	UDB	UDB Level DMA request
2'b10	UDB EDGE	UDB Edge Detect DMA request
2'b11	RESERVED	RESERVED

1.3.1267 CACHERAM_DATA[0..255]

Cache SRAM

Reset: N/A

Register : Address

CACHERAM_DATA: 0x40030000-0x400303FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cache_sram							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cache_sram							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cache_sram							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cache_sram							

This is actually two interleaved instances of s8tssc_128x32. Address bit 2 selects which of the two memories is selected.

Bits	Name	Description
31:0	cache_sram[31:0]	(no description)

1.3.1268 SFR_GPIO0

GPIO0 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO0: 0x40050180

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO0							

This register is used to set the output data state for Port0

Bits	Name	Description
7:0	GPIO0[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO0_SEL register is set to high

1.3.1269 SFR_GPIRD0

GPIRD0 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD0: 0x40050189

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD0							

This read only register contains pin state value of Port0

Bits	Name	Description
7:0	GPIRD0[7:0]	This register contains the pin state values of Port0 pins

1.3.1270 SFR_GPIO0_SEL

GPIO0_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO0_SEL: 0x4005018A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO0_SEL							

This register is used to select the GPIO0 register to set the output data state for Port0

Bits	Name	Description
7:0	GPIO0_SEL[7:0]	This register is used to select each bit of the GPIO0 register to set the output data state for the corresponding pin of Port0.

1.3.1271 SFR_GPIO1

GPIO1 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO1: 0x40050190

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO1							

This register is used to set the output data state for Port1

Bits	Name	Description
7:0	GPIO1[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO1_SEL register is set to high

1.3.1272 SFR_GPIRD1

GPIRD1 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD1: 0x40050191

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD1							

This read only register contains pin state value of Port1

Bits	Name	Description
7:0	GPIRD1[7:0]	This register contains the pin state values of Port1 pins

1.3.1273 SFR_GPIO2

GPIO2 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO2: 0x40050198

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO2							

This register is used to set the output data state for Port2

Bits	Name	Description
7:0	GPIO2[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO2_SEL register is set to high

1.3.1274 SFR_GPIRD2

GPIRD2 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD2: 0x40050199

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD2							

This read only register contains pin state value of Port2

Bits	Name	Description
7:0	GPIRD2[7:0]	This register contains the pin state values of Port2 pins

1.3.1275 SFR_GPIO2_SEL

GPIO2_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO2_SEL: 0x4005019A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO2_SEL							

This register is used to select the GPIO2 register to set the output data state for Port2

Bits	Name	Description
7:0	GPIO2_SEL[7:0]	This register is used to select each bit of the GPIO2 register to set the output data state for the corresponding pin of Port2.

1.3.1276 SFR_GPIO1_SEL

GPIO1_SEL Register

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO1_SEL: 0x400501A2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO1_SEL							

This register is used to select the GPIO1 register to set the output data state for Port1

Bits	Name	Description
7:0	GPIO1_SEL[7:0]	This register is used to select each bit of the GPIO1 register to set the output data state for the corresponding pin of Port1.

1.3.1277 SFR_GPIO3

GPIO3 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO3: 0x400501B0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO3							

This register is used to set the output data state for Port3

Bits	Name	Description
7:0	GPIO3[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO3_SEL register is set to high

1.3.1278 SFR_GPIRD3

GPIRD3 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD3: 0x400501B1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD3							

This read only register contains pin state value of Port3

Bits	Name	Description
7:0	GPIRD3[7:0]	This register contains the pin state values of Port3 pins

1.3.1279 SFR_GPIO3_SEL

GPIO3_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO3_SEL: 0x400501B2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO3_SEL							

This register is used to select the GPIO3 register to set the output data state for Port3

Bits	Name	Description
7:0	GPIO3_SEL[7:0]	This register is used to select each bit of the GPIO3 register to set the output data state for the corresponding pin of Port3.

1.3.1280 SFR_GPIO4

GPIO4 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO4: 0x400501C0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO4							

This register is used to set the output data state for Port4

Bits	Name	Description
7:0	GPIO4[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO4_SEL register is set to high

1.3.1281 SFR_GPIRD4

GPIRD4 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD4: 0x400501C1

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD4							

This read only register contains pin state value of Port4

Bits	Name	Description
7:0	GPIRD4[7:0]	This register contains the pin state values of Port4 pins

1.3.1282 SFR_GPIO4_SEL

GPIO4_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO4_SEL: 0x400501C2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO4_SEL							

This register is used to select the GPIO4 register to set the output data state for Port4

Bits	Name	Description
7:0	GPIO4_SEL[7:0]	This register is used to select each bit of the GPIO4 register to set the output data state for the corresponding pin of Port4.

1.3.1283 SFR_GPIO5

GPIO5 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO5: 0x400501C8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO5							

This register is used to set the output data state for Port5

Bits	Name	Description
7:0	GPIO5[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO5_SEL register is set to high

1.3.1284 SFR_GPIRD5

GPIRD5 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD5: 0x400501C9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD5							

This read only register contains pin state value of Port5

Bits	Name	Description
7:0	GPIRD5[7:0]	This register contains the pin state values of Port5 pins

1.3.1285 SFR_GPIO5_SEL

GPIO5_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO5_SEL: 0x400501CA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO5_SEL							

This register is used to select the GPIO5 register to set the output data state for Port5

Bits	Name	Description
7:0	GPIO5_SEL[7:0]	This register is used to select each bit of the GPIO5 register to set the output data state for the corresponding pin of Port5.

1.3.1286 SFR_GPIO6

GPIO6 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO6: 0x400501D8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO6							

This register is used to set the output data state for Port6

Bits	Name	Description
7:0	GPIO6[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO6_SEL register is set to high

1.3.1287 SFR_GPIRD6

GPIRD6 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD6: 0x400501D9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD6							

This read only register contains pin state value of Port6

Bits	Name	Description
7:0	GPIRD6[7:0]	This register contains the pin state values of Port6 pins

1.3.1288 SFR_GPIO6_SEL

GPIO6_SEL Register

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO6_SEL: 0x400501DA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO6_SEL							

This register is used to select the GPIO6 register to set the output data state for Port6

Bits	Name	Description
7:0	GPIO6_SEL[7:0]	This register is used to select each bit of the GPIO6 register to set the output data state for the corresponding pin of Port6.

1.3.1289 SFR_GPIO12

GPIO12 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO12: 0x400501E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO12							

This register is used to set the output data state for Port12

Bits	Name	Description
7:0	GPIO12[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO12_SEL register is set to high

1.3.1290 SFR_GPIRD12

GPIRD12 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD12: 0x400501E9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	W							
Retention	RET							
Name	GPIRD12							

This read only register contains pin state value of Port12

Bits	Name	Description
7:0	GPIRD12[7:0]	This register contains the pin state values of Port12 pins

1.3.1291 SFR_GPIO12_SEL

GPIO12_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO12_SEL: 0x400501F2

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO12_SEL							

This register is used to select the GPIO12 register to set the output data state for Port12

Bits	Name	Description
7:0	GPIO12_SEL[7:0]	This register is used to select each bit of the GPIO12 register to set the output data state for the corresponding pin of Port12.

1.3.1292 SFR_GPIO15

GPIO15 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO15: 0x400501F8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO15							

This register is used to set the output data state for Port15

Bits	Name	Description
7:0	GPIO15[7:0]	The data written to this register specifies the high or low state for GPIO pin if the corresponding bit of GPIO15_SEL register is set to high

1.3.1293 SFR_GPIRD15

GPIRD15 Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIRD15: 0x400501F9

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	\multicolumn{8}{c}{R:11000000}							
HW Access	\multicolumn{8}{c}{W}							
Retention	\multicolumn{8}{c}{RET}							
Name	\multicolumn{8}{c}{GPIRD15}							

This read only register contains pin state value of Port15

Bits	Name	Description
7:0	GPIRD15[7:0]	This register contains the pin state values of Port15 pins

1.3.1294 SFR_GPIO15_SEL

GPIO15_SEL Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

SFR_GPIO15_SEL: 0x400501FA

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	RET							
Name	GPIO15_SEL							

This register is used to select the GPIO15 register to set the output data state for Port15

Bits	Name	Description
7:0	GPIO15_SEL[7:0]	This register is used to select each bit of the GPIO15 register to set the output data state for the corresponding pin of Port15.

1.3.1295 P3BA_Y_START

Y_START

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_Y_START: 0x40050300

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0000000						
HW Access	NA	R						
Retention	NA	NONRET						
Name	RSVD	y_start						

This register is used to store the Y address value of the target memory. It corresponds to the column address of the target memory on which the memory test begins. In case there is only one column in the memory, both y_start and the y_roll values have to be zero.

Bits	Name	Description
6:0	y_start[6:0]	This is the starting value of Y address.

1.3.1296 P3BA_YROLL

YROLL

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_YROLL: 0x40050301

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0000000						
HW Access	NA	R						
Retention	NA	NONRET						
Name	RSVD	y_roll						

This register is used to store the roll-over value of the Y address range for the target memory. It corresponds to the column address of the target memory, which value when reached by y_curr results in y_curr value rolling over to y_start or memory test being ended (refer to fast_x). The value depends on the physical map of the memory. In case there is only one column in the memory, both y_start and the y_roll values have to be zero.

Bits	Name	Description
6:0	y_roll[6:0]	This is the roll-over value for Y address.

1.3.1297 P3BA_YCFG

YCFG

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_YCFG: 0x40050302

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:0	R/W:0000000						
HW Access	R	R						
Retention	NONRET	NONRET						
Name	y_sub	y_inc						

This register is used to store the increment/decrement step value for Y address and the direction of the increment. The y_inc corresponds to the data width of the memory (in bytes). In case there is only one column in the memory, the y_inc value has to be zero. The y_sub specifies if the y_curr has to be incremented by y_inc or decremented by y_inc. Care should be taken while setting this bit, so that the calculates y_curr always lies between y_start and y_roll.

Bits	Name	Description
7	y_sub	1'b0: y_curr is incremented by a value of y_inc. (y_sub can be 1'b0 only when y_roll >= y_start) 1'b1: y_curr is decremented by a value of y_inc. (y_sub can be 1'b0 only when y_roll <= y_start)
6:0	y_inc[6:0]	This is the increment/decrement step value for Y address.

1.3.1298 P3BA_X_START1

X_START1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_X_START1: 0x40050303

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	x_start1							

x_start is the starting value of X address and corresponds to the row address of the target memory on which the test begins. This register is used to store bits [7:0] of the x_start address of the target memory.

Bits	Name	Description
7:0	x_start1[7:0]	Bits (7:0) of x_start.

1.3.1299 P3BA_X_START2

X_START2

Reset:　　　　Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_X_START2: 0x40050304

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	x_start2							

This register is used to store bits [15:8] of the x_start address of the target memory.

Bits	Name	Description
7:0	x_start2[7:0]	Bits (15:8) of x_start.

1.3.1300 P3BA_XROLL1

XROLL1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_XROLL1: 0x40050305

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	x_roll1							

x_roll is the roll-over value of X address range for the target memory. It corresponds to the row address of the target memory, which value when reached by x_curr results in x_curr value rolling over to x_start or memory test being ended (refer to fast_x). The value depends on the physical map of the memory. This register is used to store bits [7:0] of the x_roll address of the target memory.

Bits	Name	Description
7:0	x_roll1[7:0]	Bits (7:0) of x_roll.

1.3.1301 P3BA_XROLL2

XROLL2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_XROLL2: 0x40050306

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	x_roll2							

This register is used to store bits [15:8] of the x_roll address of the target memory.

Bits	Name	Description
7:0	x_roll2[7:0]	Bits (15:8) of x_roll.

1.3.1302 P3BA_XINC

XINC

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_XINC: 0x40050307

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	x_inc							

This register is used to store the increment/decrement step value for Y address. The x_inc corresponds to the row address increment value of the target memory (in bytes).

Bits	Name	Description
7:0	x_inc[7:0]	This is the increment/decrement step value for X address. This depends on y_start and y_roll

1.3.1303 P3BA_XCFG

XCFG

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_XCFG: 0x40050308

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:0	R/W:0
HW Access	NA						R	R
Retention	NA						NONRET	NONRET
Name	RSVD						fast_x	x_sub

This register is used to store the direction of the increment and the priority of increment. The x_sub specifies if the x_curr has to be incremented by y_inc or decremented by y_inc. Care should be taken while setting this bit, so that the calculated x_curr always lies between x_start and x_roll.

Bits	Name	Description
1	fast_x	This bit when set causes incrementing to occur primarily on x_curr (fast-x) instead of on y_curr (fast-y). See Table 1-901.
0	x_sub	1'b0: x_curr is incremented by a value of x_inc. (x_sub can be 1'b0 only when x_roll >= x_start) 1'b1: x_curr is decremented by a value of x_inc. (x_sub can be 1'b0 only when x_roll <= x_start)

Table 1-901. Bit field encoding: fast_x_enum

Value	Name	Description
1'b1	FAST_X	Fast X incrementing: x_curr increments/decrements for each sequence. y_curr increments/decrements when x_curr reaches x_roll. The memory test is terminated when both x_curr and y_curr reach the roll-over values.
1'b0	FAST_Y	Fast Y incrementing: y_curr increments/decrements for each sequence. x_curr increments/decrements when y_curr reaches y_roll. The memory test is terminated when both x_curr and y_curr reach the roll-over values.

1.3.1304 P3BA_OFFSETADDR1

OFFSETADDR1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_OFFSETADDR1: 0x40050309

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	offset_addr1							

The offset address (offset_addr) corresponds to the peripheral address of the target memory. This register is used to store bits (7:0) of the offset address.

Bits	Name	Description
7:0	offset_addr1[7:0]	Bits (7:0) of offset address.

1.3.1305 P3BA_OFFSETADDR2

OFFSETADDR2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_OFFSETADDR2: 0x4005030A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	offset_addr2							

This register is used to store bits (15:8) of the offset address.

Bits	Name	Description
7:0	offset_addr2[7:0]	Bits (15:8) of offset address.

1.3.1306 P3BA_OFFSETADDR3

OFFSETADDR3

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_OFFSETADDR3: 0x4005030B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	offset_addr3							

This register is used to store bits (23:16) of the offset address.

Bits	Name	Description
7:0	offset_addr3[7:0]	Bits (23:16) of offset address.

1.3.1307 P3BA_ABSADDR1

ABSADDR1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_ABSADDR1: 0x4005030C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	abs_addr1							

The absolute address (abs_addr) corresponds to the complete address of a memory location in the target memory. Absolute address is generated by OR ing offset address (h), current X address (x) and current Y address (y) in the following manner hhhh_hhhh_hhhh_hhhh_0000_0000 0000_0000_xxxx_xxxx_xxxx_xxxx 0000_0000_0000_0000_0yyy_yyyy It can be seen that some of the bits overlap. In the overlapping bits, there should be no conflicting bits; only one of the address fields can have valid value and the other fields should have zero. For instance, in Leopard, while testing CAN memory the OR function would   look   like   0000_0000_1010_0000_0000_0000   0000_0000_0000_00xx_xxx0_0000 0000_0000_0000_0000_000y_yyyy In the above function, bits [23:12] corresponds to peripheral addressing, bits [9:2] corresponds to X address and bits [1:0] corresponds to Y address. There is no conflicting overlap. Similarly, for other memories there should be no conflicting overlaps. When read in debug mode this value corresponds to the address of the memory location on which the memory test was last done. This register is used to store bits (7:0) of the absolute address.

Bits	Name	Description
7:0	abs_addr1[7:0]	Bits (7:0) of the absolute address.

1.3.1308 P3BA_ABSADDR2

ABSADDR2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_ABSADDR2: 0x4005030D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	abs_addr2							

Register used to store bits (15:8) of the absolute address.

Bits	Name	Description
7:0	abs_addr2[7:0]	Bits (15:8) of the absolute address.

1.3.1309 P3BA_ABSADDR3

ABSADDR3

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_ABSADDR3: 0x4005030E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	abs_addr3							

Register used to store bits (23:16) of the absolute address.

Bits	Name	Description
7:0	abs_addr3[7:0]	Bits (23:16) of the absolute address.

1.3.1310 P3BA_ABSADDR4

ABSADDR4

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_ABSADDR4: 0x4005030F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	abs_addr4							

Register used to store bits (31:24) of the absolute address.

Bits	Name	Description
7:0	abs_addr4[7:0]	Bits (31:24) of the absolute address.

1.3.1311 P3BA_DATCFG1

DATCFG1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_DATCFG1: 0x40050310

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R							
Retention	NONRET							
Name	data_invert_mask							

This register is used to store data inversion address mask. The data invert mask is an address pattern used to invert the data. The logic used to generate data invert signal is masked_addr = data_invert_mask[7:0] & mstr_haddr[7:0];   data_invert = ^(masked_addr); -- reduction XOR of masked_addr.   Based on this data invert signal and the current opcode (regular or inverted), the data is either inverted or is used uninverted.

Bits	Name	Description
7:0	data_invert_mask[7:0]	The 8 bit data invert mask

1.3.1312 P3BA_DATCFG2

DATCFG2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_DATCFG2: 0x40050311

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:00		R/W:0
HW Access	NA					R		R
Retention	NA					NONRET		NONRET
Name	RSVD					data_pattern		data_ovr

This register contains the data override bit and data pattern. When a memory test is initiated, this bit is used either to repli-cate the data pattern into the data register or to override the data pattern and preserve the explicitly written contents of the data register The data pattern is the basic 2-bit pattern which, if data_ovr is not set, is replicated to generate data.

Bits	Name	Description
2:1	data_pattern[1:0]	Basic 2-bit data pattern.
0	data_ovr	1'b0: State machine enters INIT state and data pattern bits are replicated in the data_reg. 1'b1: State machine skips INIT state and the contents of the data_reg are preserved.

1.3.1313 P3BA_CMP_RSLT1

CMP_RSLT1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_CMP_RSLT1: 0x40050314

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	comp_rslt1							

The compare result (cmp_rslt) is the XOR'd result of registered hrdata and the expected data during master mode. The comparison is done only when a read operation is performed. This register contains bits (7:0) of the cmp_rslt.

Bits	Name	Description
7:0	comp_rslt1[7:0]	Bits(7:0) of the comp_rslt.

1.3.1314 P3BA_CMP_RSLT2

CMP_RSLT2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_CMP_RSLT2: 0x40050315

Bits	7	6	5	4	3	2	1	0

SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	NONRET							
Name	comp_rslt4							

This register contains bits (31:24) of the cmp_rslt.

Bits	Name	Description
7:0	comp_rslt4[7:0]	Bits(31:24) of the comp_rslt.

1.3.1317 P3BA_DATA_REG1

DATA_REG1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_DATA_REG1: 0x40050318

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_reg1							

The data register (data_reg) stores the data that is used to write into the target memory. Data can directly be written into the register (and preserved during a memory test by setting data_ovr bit to 1'b1) or can be generated, when a memory test is initiated from the data_pattern, by setting data_ovr bit to 1'b0. This register contains bits (7:0) of the data_reg.

Bits	Name	Description
7:0	data_reg1[7:0]	Bits (7:0) of the data.

1.3.1318 P3BA_DATA_REG2

DATA_REG2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_DATA_REG2: 0x40050319

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_reg2							

This register contains bits (15:8) of the data_reg.

Bits	Name	Description
7:0	data_reg2[7:0]	Bits (15:8) of the data.

1.3.1319 P3BA_DATA_REG3

DATA_REG3

Reset:　　　　Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_DATA_REG3: 0x4005031A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	NONRET							
Name	data_reg3							

This register contains bits (23:16) of the data_reg.

Bits	Name	Description
7:0	data_reg3[7:0]	Bits (23:16) of the data.

1.3.1320 P3BA_DATA_REG4

DATA_REG4

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

Retention	NONRET							
Name	mstr_hrdata4							

This register contains bits (31:24) of the mstr_hrdata.

Bits	Name	Description
7:0	mstr_hrdata4[7:0]	Bits (31:24) of the mstr_hrdata.

1.3.1329 P3BA_BIST_EN

BIST_EN

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_BIST_EN: 0x40050324

Bits	7	6	5	4	3	2	1	0
SW Access:Reset			NA:00000			R/W:1	R/W:0	R/W:0
HW Access			NA			R/W	R/W	R/W
Retention			NA			NONRET	NONRET	NONRET
Name			RSVD			passing	init_compl	bist_go

This register is used to store the values for system control and initialization status bit. The bist_go bit, when set to 1'b1, initiates a memory test. When data_ovr bit is not set and when memory test is initiated, data initialization state is entered. During this state the data_reg is updated with data_pattern bits and the initialization complete (init_compl) bit is set. The passing bit is used to track the pass status of the memory test. Before starting a memory test the bit has to be set to 1'b1 by the software.

Bits	Name	Description
2	passing	This bit has to be set to 1'b1 before starting a memory test. During and at the end of a memory test if passing bit is 1'b0: A failure was encountered during the memory test. 1'b1: The memory test passed.
1	init_compl	1'b0: When data_ovr bit is set the init state is skipped. The init_compl bit is not set. 1'b1: When data_ovr bit is set the state machine enters init state, replicates data pattern bits in the data_reg and sets init_compl to 1'b1
0	bist_go	1'b0: The block is in slave mode. The slave AHB interface is active. The master AHB interface is inactive. 1'b1: The block enters master mode and a memory test in initiated. The master AHB interface is active. The slave AHB interface is inactive. The default bus master (a microcontroller) is stalled.

1.3.1330 P3BA_PHUB_MASTER_SSR

PHUB_MASTER_SSR

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_PHUB_MASTER_SSR: 0x40050325

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:00	
HW Access	NA					R	R	
Retention	NA					NONRET	NONRET	
Name	RSVD					bits24_true	mstr_hsize	

This register contains the mstr_hsize and bits24_true. The master AHB interface hsize (mstr_hsize) is used to specify the memory access data width. This should be equal to or less than the data width of the target memory. For example, the USB block has a data width of 16 bits then the Bist Assist block can perform a 16 bit memory access or an 8 bit memory access, but not a 32 bit memory access. The bits24_true is used to identify if the target memory is a 24 bit memory.

Bits	Name	Description
2	bits24_true	This bit is valid only when mstr_hsize is 2'b10. 1'b0: The target memory is a 32 bit memory. 1'b1: The target memory is a 24 bit memory. The MS byte of the data in all memory transactions are ignored
1:0	mstr_hsize[1:0]	This field is used to identify the size of the spoke for synchronization with PHUB.

1.3.1331 P3BA_SEQCFG1

SEQCFG1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_SEQCFG1: 0x40050326

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:000			R/W:000			R/W:1
HW Access	NA	R			R			R
Retention	NA	NONRET			NONRET			NONRET
Name	RSVD	opcode_2			opcode_1			pre_address

This register is used to store the first two opcodes in the test sequence and the pre_address bit. The two opcodes will perform the first two operations in the state machine after the memory test is initiated. When the pre address bit is set, a single read is executed on the address corresponding to x_roll, y_roll and results ignored, immediately before executing the programmed sequence starting at the address corresponding to x_start, ystart. This provides full address transition coverage.

Bits	Name	Description
6:4	opcode_2[2:0]	second opcode See Table 1-902.
3:1	opcode_1[2:0]	first opcode See Table 1-902.
0	pre_address	1'b0: Pre address state is skipped. Sequence starts from address corresponding to x_address, y_address. 1'b1: Pre address state is entered and a single read on the address corresponding to x_roll, y_roll.

Table 1-902. Bit field encoding: opcode_enum

Value	Name	Description
3'b000	NOOP	Execute Wait State
3'b011	RDATA	Execute Read and compare with data
3'b100	RDATABAR	Execute Read and compare with inverted data
3'b001	WDATA	Execute Write with data
3'b010	WDATABAR	Execute Write with inverted data
3'b101	EXCLUDE	Do not execute anything. Skip opcode.

1.3.1332 P3BA_SEQCFG2

SEQCFG2

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_SEQCFG2: 0x40050327

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0	R/W:000			R/W:000		
HW Access	NA	R	R			R		
Retention	NA	NONRET	NONRET			NONRET		
Name	RSVD	bist_stop	opcode_4			opcode_3		

This register is used to store the last two opcodes in the test sequence and bist_stop bit. The two opcodes will perform the las two operations in the state machine after the memory test is initiated. The bit stop bit is used to enter the debug mode when a fail is encountered.

Bits	Name	Description
6	bist_stop	1'b0: The state machine does not stop when a fail is encountered. 1'b1: The state machine stops and enters debug mode when a fail is encountered.
5:3	opcode_4[2:0]	fourth opcode See Table 1-903.
2:0	opcode_3[2:0]	third opcode See Table 1-903.

Table 1-903. Bit field encoding: opcode_enum

Value	Name	Description
3'b000	NOOP	Execute Wait State
3'b011	RDATA	Execute Read and compare with data
3'b100	RDATABAR	Execute Read and compare with inverted data
3'b001	WDATA	Execute Write with data
3'b010	WDATABAR	Execute Write with inverted data
3'b101	EXCLUDE	Do not execute anything. Skip opcode.

1.3.1333 P3BA_Y_CURR

Y_CURR

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

P3BA_Y_CURR: 0x40050328

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R:0000000						
HW Access	NA	R/W						
Retention	NA	NONRET						
Name	RSVD	y_curr						

This register is used to store the current Y address value of the target memory. When read in debug mode it corresponds to the column address of the memory location on which the memory test was last done.

Bits	Name	Description
6:0	y_curr[6:0]	This is the current value of Y address.
		Counter

1.3.1334 P3BA_X_CURR1

X_CURR1

Reset: Domain reset for non-retention flops [reset_all_nonretention]

Register : Address

SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Enable the Serial Wire Viewer (SWV) mode. Only 1 of the following 2 modes should enabled at a time. If both modes are enabled, then the TRACE mode is output.

Bits	Name	Description
31:2	RSVD[29:0]	Reserved
1	TRACE_MODE	Trace Mode. 1=Trace Mode enable. Send Trace Data to GPIO pins P2.7-P2.4. Send TRACECLK to P2.3. 0=Normal operation. Trace disabled.
0	SWV_MODE	SWV Mode. 1= SWV Mode enable.SWV Data sent onto GPIO pin P2.3. 0= Normal operation.SWV Mode disabled.

1.3.1338 PANTHER_DBG_CFG

Embedded Trace Overflow Stall

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PANTHER_DBG_CFG: 0x4008000C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:000000						R/W:0	R/W:1
HW Access	R						R	R
Retention	NA						RET	RET

SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

Prevent the ETM FIFO from overflowing by stalling the CPU until the FIFO has enough room for more trace data.

Bits	Name	Description
31:2	RSVD[29:0]	Reserved
1	BOOT_CM3SYSRST_BY PASS	CM3 system reset configuration during boot process 0 --> no effect 1 --> bypasses the CM3 system reset during boot.

1.3.1338 **PANTHER_DBG_CFG** (continued)

0   EMTOFLOW   The CM3 has built in Embedded Trace logic which compresses the trace data, so it can be transferred in real-time. However, this compression can cause the FIFO in the ETM logic to overflow. When the ETM fifo fills, this bit can be used to either cause the CPU to stall until there is enough room for more data in the FIFO, or to simply loose data and not stall the CPU.
0=CPU will free-run even if the ETM FIFO is full. Trace data will be lost.
1=CPU will stall when the ETM FIFO is full.

1.3.1339 PANTHER_CM3_LCKRST_STAT

Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

PANTHER_CM3_LCKRST_STAT: 0x40080018

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:000000						RC:0	RC:0
HW Access	R						R/W	R/W
Retention	NA						RET	RET
Name	RSVD						CM3LOCKUP_STAT	CM3SYSRST_STAT

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R							
Retention	NA							
Name	RSVD							

This configuration register is used for PVT controller bit fields. The only bit used right now is bit [0].

Bits	Name	Description
31:2	RSVD[29:0]	Reserved
1	CM3LOCKUP_STAT	This bit is used to indicate whether CM3 CPU got locked while executing instructions. 1= 1 indicates CM3 CPU got locked-up. 0= 0 Indicates there is no lockup of CM3 CPU
0	CM3SYSRST_STAT	This bit is used to indicate whether any system reset was requested by CM3. 1= 1 indicates CM3 requested a system reset, will be cleared on reading the register. 0= 0 Indicates there is no system reset request from CM3.

1.3.1340 PANTHER_DEVICE_ID

Device Identification

Reset: N/A

Register : Address

PANTHER_DEVICE_ID: 0x4008001C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	W							
Retention	RET							
Name	dev_id							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:UUUUUUUU							
HW Access	W							
Retention	RET							
Name	dev_id

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:UUUUUUUU							
HW Access	W							
Retention	RET							
Name	dev_id							

This register stores the device identification number also known as the JTAG ID.

Bits	Name	Description
31:0	dev_id[31:0]	Stores the device identification number also known as the JTAG ID

1.3.1341 FLSHID_RSVD[0..127]

RSVD

Reset: N/A

Register : Address

FLSHID_RSVD: 0x49000000-0x4900007F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	RSVD							

Bits	Name	Description
7:0	RSVD[7:0]	(no description)

1.3.1342 FLSHID_CUST_MDATA[0..127]

Customer Meta Data

Reset: N/A

Register : Address

FLSHID_CUST_MDATA: 0x49000080-0x490000FF

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	cust_mdata							

Contains customer meta data such as information on the programmer used and the build number of the Cypress tool used. See Flash chapter in the IROS for more information on the use of this field and a breakdown of the individual bytes

Bits	Name	Description
7:0	cust_mdata[7:0]	Customer Meta Data

1.3.1343 FLSHID_CUST_TABLES_Y_LOC

Y location

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_Y_LOC: 0x49000100

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	y_loc							

Y location of die on the wafer

Bits	Name	Description
7:0	y_loc[7:0]	Y location of die on the wafer (row number)

1.3.1344 FLSHID_CUST_TABLES_X_LOC

X location

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_X_LOC: 0x49000101

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	x_loc							

X location of die on the wafer

Bits	Name	Description
7:0	x_loc[7:0]	X location of die on the wafer (column number)

1.3.1345 FLSHID_CUST_TABLES_WAFER_NUM

Wafer Number

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_WAFER_NUM: 0x49000102

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	wafer_num							

Wafer Number

Bits	Name	Description
7:0	wafer_num[7:0]	Wafer Number: 1 to 24

1.3.1346 FLSHID_CUST_TABLES_LOT_LSB

Lot Number LSB

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_LOT_LSB: 0x49000103

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	lot_lsb							

Lot Number LSB

Bits	Name	Description
7:0	lot_lsb[7:0]	LSB of lot number/wafer start

1.3.1347 FLSHID_CUST_TABLES_LOT_MSB

Lot Number MSB

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_LOT_MSB: 0x49000104

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	lot_msb							

Lot Number MSB

Bits	Name	Description
7:0	lot_msb[7:0]	MSB of lot number/wafer start

1.3.1348 FLSHID_CUST_TABLES_WRK_WK

Work Week

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_WRK_WK: 0x49000105

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	work_week							

Work week

Bits	Name	Description
7:0	work_week[7:0]	Work week: 1 to 53

1.3.1349 FLSHID_CUST_TABLES_FAB_YR

Fab/Yr

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_FAB_YR: 0x49000106

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0000				R:0000			
HW Access	R/W				R/W			
Retention	RET				RET			
Name	year				fab			

Fab ID and Year Produced

Bits	Name	Description
7:4	year[3:0]	Year: 0 to 9
3:0	fab[3:0]	Fab Number: 4 or 5

1.3.1350 FLSHID_CUST_TABLES_MINOR

Minor Part Number

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_MINOR: 0x49000107

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	minor							

Marketing part number - minor

Bits	Name	Description
7:0	minor[7:0]	Marketing part number - minor: 000 to 999

1.3.1351 FLSHID_CUST_TABLES_IMO_3MHZ

IMO Trim - 3 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_3MHZ: 0x49000108

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_3mhz							

IMO Frequency Trim - 3 MHz

Bits	Name	Description
7:0	imo_3mhz[7:0]	IMO Frequency Trim - 3 MHz: trim value to write to register IMO.TR1 to trim for 3 MHz setting

1.3.1352 FLSHID_CUST_TABLES_IMO_6MHZ

IMO Trim - 6 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_6MHZ: 0x49000109

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_6mhz							

IMO Frequency Trim - 6 MHz

Bits	Name	Description
7:0	imo_6mhz[7:0]	IMO Frequency Trim - 6 MHz: trim value to write to register IMO.TR1 to trim for 6 MHz setting

1.3.1353 FLSHID_CUST_TABLES_IMO_12MHZ

IMO Trim - 12 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_12MHZ: 0x4900010A

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_12mhz							

IMO Frequency Trim - 12 MHz

Bits	Name	Description
7:0	imo_12mhz[7:0]	IMO Frequency Trim - 12 MHz: trim value to write to register IMO.TR1 to trim for 12 MHz setting

1.3.1354 FLSHID_CUST_TABLES_IMO_24MHZ

IMO Trim - 24 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_24MHZ: 0x4900010B

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_24mhz							

IMO Frequency Trim - 24 MHz

Bits	Name	Description
7:0	imo_24mhz[7:0]	IMO Frequency Trim - 24 MHz: trim value to write to register IMO.TR1 to trim for 24 MHz setting

1.3.1355 FLSHID_CUST_TABLES_IMO_67MHZ

IMO Trim - 67 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_67MHZ: 0x4900010C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_67mhz							

IMO Frequency Trim - 67 MHz

Bits	Name	Description
7:0	imo_67mhz[7:0]	IMO Frequency Trim - 67 MHz: trim value to write to register IMO.TR1 to trim for 67 MHz setting

1.3.1356 FLSHID_CUST_TABLES_IMO_80MHZ

IMO Trim - 80 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_80MHZ: 0x4900010D

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_80mhz							

IMO Frequency Trim - 80 MHz

Bits	Name	Description
7:0	imo_80mhz[7:0]	IMO Frequency Trim - 80 MHz: trim value to write to register IMO.TR1 to trim for 80 MHz setting

1.3.1357 FLSHID_CUST_TABLES_IMO_92MHZ

IMO Trim - 92 MHz

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_92MHZ: 0x4900010E

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_92mhz							

IMO Frequency Trim - 92 MHz

Bits	Name	Description
7:0	imo_92mhz[7:0]	IMO Frequency Trim - 92 MHz: trim value to write to register IMO.TR1 to trim for 92 MHz setting

1.3.1358 FLSHID_CUST_TABLES_IMO_USB

IMO Trim - USB Mode

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_IMO_USB: 0x4900010F

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	imo_usb							

IMO Frequency Trim - USB Mode

Bits	Name	Description
7:0	imo_usb[7:0]	IMO Frequency Trim - USB Mode: trim value to write to register IMO.TR1 to trim for USB mode setting

1.3.1359 FLSHID_CUST_TABLES_CMP0_TR0_HS

CMP0_TR0 High Speed

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_CMP0_TR0_HS: 0x49000110

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	cmp0_tr0_hs							

Trim for CMP0_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp0_tr0_hs[7:0]	Trim for CMP0_TR0 for offset high speed mode (mode 1)

1.3.1360 FLSHID_CUST_TABLES_CMP1_TR0_HS

CMP1_TR0 High Speed

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_CMP1_TR0_HS: 0x49000111

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	cmp1_tr0_hs							

Trim for CMP1_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp1_tr0_hs[7:0]	Trim for CMP1_TR0 for offset high speed mode (mode 1)

1.3.1361 FLSHID_CUST_TABLES_CMP2_TR0_HS

CMP2_TR0 High Speed

Reset: System reset for retention flops [reset_all_retention]

Register : Address

FLSHID_CUST_TABLES_CMP2_TR0_HS: 0x49000112

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	cmp2_tr0_hs							

Trim for CMP2_TR0 for offset high speed mode (mode 1)

Bits	Name	Description
7:0	cmp2_tr0_hs[7:0]	Trim for CMP2_TR0 for offset high speed mode (mode 1)

1.3.1362 FLSHID_CUST_TABLES_CMP3_TR0_HS

CMP3_TR0 High Speed

Reset: System reset for retention flops [reset_all_retention]

Register : Address

Name	RSVD							

Use this register to configure and control ITM transfers.

Bits	Name	Description
23	BUSY	Set when ITM events present and being drained
22:16	ATBID[6:0]	ATB ID for CoreSight system.
9:8	TSPrescale[1:0]	Timestamp prescaler: 0b00 = no prescaling 0b01 = divide by 4 0b10 = divide by 16 0b11 = divide by 64.
4	SWOENA	Enable SWV behavior - count on TPIUEMIT and TPIUBAUD.
3	DWTENA	Enables the DWT stimulus.

1.3.1410   ITM_TRACE_CTRL (continued)

2	SYNCENA	Enables sync packets for TPIU.
1	TSENA	Enables differential timestamps. Differential timestamps are emitted when a packet is written to the FIFO with a non-zero timestamp counter, and when the timestamp counter overflows. Timestamps are emitted during idle times after a fixed number of cycles. This provides a time reference for packets and inter-packet gaps.
0	ITMENA	Enable ITM. This is the master enable, and must be set before ITM Stimulus and Trace Enable registers can be written.

1.3.1411 ITM_LOCK_ACCESS

ITM Lock Access Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ITM_LOCK_ACCESS: 0xE0000FB0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R/W							
Retention	RET							
Name	lock_access							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	W:00000000							
HW Access	R/W							
Retention	RET							
Name	lock_access							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	W:00000000							
HW Access	R/W							
Retention	RET							
Name	lock_access							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	W:00000000							
HW Access	R/W							
Retention	RET							
Name	lock_access							

Use this register to prevent write accesses to the Control Register.

Bits	Name	Description
31:0	lock_access[31:0]	A privileged write of 0xC5ACCE55 enables more write access to Control Register 0xE00::0xFFC. An invalid write removes write access.

1.3.1412 ITM_LOCK_STATUS

ITM Lock Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ITM_LOCK_STATUS: 0xE0000FB4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R:0	R:1	R:1
HW Access	NA					R/W	R/W	R/W
Retention	NA					RET	RET	RET
Name	RSVD					ByteAcc	Access	Present

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use this register to enable write accesses to the Control Register.

Bits	Name	Description
2	ByteAcc	You cannot implement 8-bit lock accesses.
1	Access	Write access to component is blocked. All writes are ignored, reads are permitted.
0	Present	Indicates that a lock mechanism exists for this component.

1.3.1413 ITM_PID4

ITM Peripheral Identification Register 4

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ITM_PID4: 0xE0000FD0

Bits	7	6	5	4	3	2	1	0

HW Access	NA	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Retention	NA	RET	RET	RET	RET	RET	RET	RET
Name	RSVD	CYCEVTEN	FOLDEVTE-NA	LSUEVTE-NA	SLEEPE-VTENA	EXCEVTE-NA	CPIEVTE-NA	EXCTRCE-NA

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:0100				NA:0000			
HW Access	R/W				NA			
Retention	RET				NA			
Name	NUMCOMP				RSVD			

Use the DWT Control Register to enable the DWT unit.

Bits	Name	Description
31:28	NUMCOMP[3:0]	Number of comparators field. This read-only field contains b0100 to indicate four comparators.
22	CYCEVTEN	Enables Cycle count event. Emits an event when the POSTCNT counter triggers it. See CYC-TAP (bit [9]) and POSTPRESET, bits [4:1], for details. 1 = Cycle count events enabled 0 = Cycle count events disabled. This event is only emitted if PCSAMPLENA, bit [12], is disabled. PCSAMPLENA overrides the setting of this bit. Reset clears the CYCEVTENA bit.

1.3.1425 DWT_CTRL (continued)

21	FOLDEVTENA	Enables Folded instruction count event. Emits an event when DWT_FOLDCNT overflows (every 256 cycles of folded instructions). A folded instruction is one that does not incur even one cycle to execute. For example, an IT instruction is folded away and so does not use up one cycle. 1 = Folded instruction count events enabled. 0 = Folded instruction count events disabled. Reset clears the FOLDEVTENA bit.
20	LSUEVTENA	Enables LSU count event. Emits an event when DWT_LSUCNT overflows (every 256 cycles of LSU operation). LSU counts include all LSU costs after the initial cycle for the instruction. 1 = LSU count events enabled. 0 = LSU count events disabled. Reset clears the LSUEVTENA bit.
19	SLEEPEVTENA	Enables Sleep count event. Emits an event when DWT_SLEEPCNT overflows (every 256 cycles that the processor is sleeping). 1 = Sleep count events enabled. 0 = Sleep count events disabled. Reset clears the SLEEPEVTENA bit.
18	EXCEVTENA	Enables Interrupt overhead event. Emits an event when DWT_EXCCNT overflows (every 256 cycles of interrupt overhead). 1 = Interrupt overhead event enabled. 0 = Interrupt overhead event disabled. Reset clears the EXCEVTENA bit.
17	CPIEVTENA	Enables CPI count event. Emits an event when DWT_CPICNT overflows (every 256 cycles of multi-cycle instructions). 1 = CPI counter events enabled. 0 = CPI counter events disabled. Reset clears the CPIEVTENA bit.
16	EXCTRCENA	Enables Interrupt event tracing: 1 = interrupt event trace enabled 0 = interrupt event trace disabled. Reset clears the EXCEVTENA bit.
12	PCSAMPLEENA	Enables PC Sampling event. A PC sample event is emitted when the POSTCNT counter triggers it. See CYCTAP, bit [9], and POSTPRESET, bits [4:1], for details. Enabling this bit overrides CYCEVTENA (bit [20]). 1 = PC Sampling event enabled. 0 = PC Sampling event disabled. Reset clears the PCSAMPLENA bit.
11:10	SYNCTAP[1:0]	Feeds a synchronization pulse to the ITM SYNCENA control. The value selected here picks the rate (approximately 1/second or less) by selecting a tap on the DWT_CYCCNT register. To use synchronization (heartbeat and hot-connect synchronization), CYCCNTENA must be set to 1, SYNCTAP must be set to one of its values, and SYNCENA must be set to 1. 0b00 = Disabled. No synch counting. 0b01 = Tap at CYCCNT bit 24. 0b10 = Tap at CYCCNT bit 26. 0b11 = Tap at CYCCNT bit 28.
9	CYCTAP	Selects a tap on the DWT_CYCCNT register. These are spaced at bits [6] and [10]: CYCTAP = 0 selects bit [6] to tap CYCTAP = 1 selects bit [10] to tap. When the selected bit in the CYCCNT register changes from 0 to 1 or 1 to 0, it emits into the POSTCNT, bits [8:5], post-scalar counter. That counter then counts down. On a bit change when post-scalar is 0, it triggers an event for PC sampling or CYCEVTCNT.

1.3.1425   DWT_CTRL (continued)

8:5	POSTCNT[3:0]	Post-scalar counter for CYCTAP. When the selected tapped bit changes from 0 to 1 or 1 to 0, the post scalar counter is down-counted when not 0. If 0, it triggers an event for PCSAMPLENA or CYCEVTENA use. It also reloads with the value from POSTPRESET (bits [4:1]).
4:1	POSTPRESET[3:0]	Reload value for POSTCNT, bits [8:5], post-scalar counter. If this value is 0, events are triggered on each tap change (a power of 2, such as 1<<6 or 1<<10). If this field has a non-0 value, this forms a count-down value, to be reloaded into POSTCNT each time it reaches 0. For example, a value 1 in this register means an event is formed every other tap change.
0	CYCCNTENA	Enable the CYCCNT counter. If not enabled, the counter does not count and no event is generated for PS sampling or CYCCNTENA. In normal use, the debugger must initialize the CYCCNT counter to 0.

1.3.1426 DWT_CYCLE_COUNT

DWT Current PC Sampler Cycle Count Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DWT_CYCLE_COUNT: 0xE0001004

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	CYCCNT							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	CYCCNT							

Use the DWT Current PC Sampler Cycle Count Register to count the number of core cycles. This count can measure elapsed execution time.

Bits	Name	Description
31:0	CYCCNT[31:0]	Current PC Sampler Cycle Counter count value. When enabled, this counter counts the number of core cycles, except when the core is halted. CYCCNT is a free running counter, counting upwards. It wraps around to 0 on overflow. The debugger must initialize this to 0 when first enabling.

1.3.1427 DWT_CPI_COUNT

DWT CPI Count Register

Reset: N/A

Register : Address

DWT_CPI_COUNT: 0xE0001008

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CPICNT

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the DWT CPI Count Register to count the total number of instruction cycles beyond the first cycle.

Bits	Name	Description
7:0	CPICNT[7:0]	Current CPI counter value. Increments on the additional cycles (the first cycle is not counted) required to execute all instructions except those recorded by DWT_LSUCNT. This counter also increments on all instruction fetch stalls. If CPIEVTENA is set, an event is emitted when the counter overflows. Clears to 0 on enabling.

1.3.1428 DWT_EXC_OVHD_COUNT

DWT Exception Overhead Count Register

Reset: N/A

Register : Address

DWT_EXC_OVHD_COUNT: 0xE000100C

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the DWT Exception Overhead Count Register to count the total cycles spent in interrupt processing.

Bits	Name	Description
7:0	EXCCNT[7:0]	Current interrupt overhead counter value. Counts the total cycles spent in interrupt processing (for example entry stacking, return unstacking, pre-emption). An event is emitted on counter overflow (every 256 cycles). This counter initializes to 0 when enabled. Clears to 0 on enabling.

1.3.1429 DWT_SLEEP_COUNT

DWT Sleep Count Register

Reset: N/A

Register : Address

DWT_SLEEP_COUNT: 0xE0001010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SLEEPCNT							

Bits	15	14	13	12	11	10	9	8

Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the DWT Sleep Count Register to count the total number of cycles during which the processor is sleeping.

Bits	Name	Description
7:0	SLEEPCNT[7:0]	Sleep counter. Counts the number of cycles during which the processor is sleeping. An event is emitted on counter overflow (every 256 cycles). This counter initializes to 0 when enabled.

1.3.1430 DWT_LSU_COUNT

DWT LSU Count Register

Reset: N/A

Register : Address

DWT_LSU_COUNT: 0xE0001014

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	LSUCNT							

Bits	15	14	13	12	11	10	9	8

Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the DWT LSU Count Register to count the total number of cycles during which the processor is processing an LSU operation beyond the first cycle.

Bits	Name	Description
7:0	LSUCNT[7:0]	LSU counter. This counts the total number of cycles that the processor is processing an LSU operation. The initial execution cost of the instruction is not counted. For example, an LDR that takes two cycles to complete increments this counter one cycle. Equivalently, an LDR that stalls for two cycles (and so takes four cycles), increments this counter three times. An event is emitted on counter overflow (every 256 cycles). Clears to 0 on enabling.

1.3.1431 DWT_FOLD_COUNT

DWT Fold Count Register

Reset: N/A

Register : Address

DWT_FOLD_COUNT: 0xE0001018

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	EIASAMPLE							

Use the DWT Program Counter Sample Register (PCSR) to enable coarse-grained software profiling using a debug agent, without changing the currently executing code. If the core is not in debug state, the value returned is the instruction address of a recently executed instruction. If the core is in debug state, the value returned is 0xFFFFFFFF.

Bits	Name	Description
31:0	EIASAMPLE[31:0]	Execution instruction address sample, or 0xFFFFFFFF if the core is halted.

1.3.1433 DWT_COMP_0

DWT Comparator Registers

Reset: N/A

Register : Address

DWT_COMP_0: 0xE0001020

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU

HW Access	R/W							
Retention	RET							
Name	COMP							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	COMP							

Use the DWT Comparator Registers 0-3 to write the values that trigger watchpoint events.

Bits	Name	Description
31:0	COMP[31:0]	Data value to compare against PC and the data address as given by DWT_FUNCTIONx. DWT_COMP0 can also compare against the value of the PC Sampler Counter (DWT_CYCCNT). DWT_COMP1 can also compare against data values so that data matching can be performed (DATAVMATCH).

1.3.1434 DWT_MASK_0

DWT Mask Registers

Reset: N/A

Register : Address

DWT_MASK_0: 0xE0001024

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:UUUU			
HW Access	NA				R/W			
Retention	NA				RET			
Name	RSVD				MASK			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the DWT Mask Registers 0-3 to apply a mask to data addresses when matching against COMP.

Bits	Name	Description
3:0	MASK[3:0]	Mask on data address when matching against COMP. This is the size of the ignore mask. So, ~0< However, the actual comparison is slightly more complex to enable matching an address wherever it appears on a bus. So, if COMP is 3, this matches a word access of 0, because 3 would be within the word.

1.3.1435 DWT_FUNCTION_0

DWT Function registers

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DWT_FUNCTION_0: 0xE0001028

SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							MATCHED

Use the DWT Function Registers 0-3 to control the operation of the comparator. Each comparator can: Match against either the PC or the data address. This is controlled by CYCMATCH. This function is only available for comparator 0 (DWT_COMP0).   Perform data value comparisons if associated address comparators have performed an address match. This function is only available for comparator 1 (DWT_COMP1).   Emit data or PC couples, trigger the ETM, or generate a watchpoint depending on the operation defined by FUNCTION.

Bits	Name	Description
24	MATCHED	This bit is set when the comparator matches, and indicates that the operation defined by FUNC-TION has occurred since this bit was last read. This bit is cleared on read.
9	LNK1ENA	Read-only: 0 = DATAVADDR1 not supported 1 = DATAVADDR1 supported (enabled).

1.3.1435   DWT_FUNCTION_0 (continued)

7	CYCMATCH	Only available in comparator 0. When set, this comparator compares against the clock cycle counter.
5	EMITRANGE	Emit range field. Reserved to permit emitting offset when range match occurs. Reset clears the EMITRANGE bit. PC sampling is not supported when EMITRANGE is enabled. EMITRANGE only applies for: FUNCTION = b0001, b0010, and b0011.
3:0	FUNCTION[3:0]	Function settings of the DWT Function Registers.

1.3.1436 DWT_COMP_1

DWT Comparator Registers

Reset: N/A

Register : Address

DWT_COMP_1: 0xE0001030

Bits	7	6	5	4	3	2	1	0

Name	RSVD							

Use the DWT Mask Registers 0-3 to apply a mask to data addresses when matching against COMP.

Bits	Name	Description
3:0	MASK[3:0]	Mask on data address when matching against COMP. This is the size of the ignore mask. So, ~0< However, the actual comparison is slightly more complex to enable matching an address wherever it appears on a bus. So, if COMP is 3, this matches a word access of 0, because 3 would be within the word.

1.3.1438 DWT_FUNCTION_1

DWT Function registers

Reset: System reset for retention flops [reset_all_retention]

Register : Address

DWT_FUNCTION_1: 0xE0001038

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00		R/W:0	NA:0	R/W:0000			
HW Access	NA		R/W	NA	R/W			
Retention	NA		RET	NA	RET			
Name	RSVD		EMI-TRANGE	RSVD	FUNCTION			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00		R/W:00		R/W:00		R:1	R/W:0
HW Access	NA		R/W		R/W		R/W	R/W
Retention	NA		RET		RET		RET	RET
Name	RSVD		DATAVADDR0		DATAVSIZE		LNK1ENA	DATAV-MATCH

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R/W	
Retention	NA						RET	
Name	RSVD						DATAVADDR1	

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							MATCHED

Use the DWT Function Registers 0-3 to control the operation of the comparator. Each comparator can: Match against either the PC or the data address. This is controlled by CYCMATCH. This function is only available for comparator 0 (DWT_COMP0). Perform data value comparisons if associated address comparators have performed an address match. This function is only available for comparator 1 (DWT_COMP1). Emit data or PC couples, trigger the ETM, or generate a watchpoint depending on the operation defined by FUNCTION.

Bits	Name	Description
24	MATCHED	This bit is set when the comparator matches, and indicates that the operation defined by FUNCTION has occurred since this bit was last read. This bit is cleared on read.
17:16	DATAVADDR1[1:0]	Identity of a second linked address comparator for data value matching when DATAVMATCH == 1 and LNK1ENA == 1.

1.3.1438   DWT_FUNCTION_1 (continued)

13:12	DATAVADDR0[1:0]	Identity of a linked address comparator for data value matching when DATAVMATCH == 1.
11:10	DATAVSIZE[1:0]	Defines the size of the data in the COMP register that is to be matched: 00 = byte 01 = halfword 10 = word 11 = Unpredictable.
9	LNK1ENA	Read-only: 0 = DATAVADDR1 not supported 1 = DATAVADDR1 supported (enabled).
8	DATAVMATCH	This bit is only available in comparator 1. When DATAVMATCH is set, this comparator performs data value compares. The comparators given by DATAVADDR0 and DATAVADDR1provide the address for the data comparison. If DATAVMATCH is set in DWT_FUNCTION1, the FUNCTION setting for the comparators given by DATAVADDR0 and DATAVADDR1 are overridden and those comparators only provide the address match for the data comparison.
5	EMITRANGE	Emit range field. Reserved to permit emitting offset when range match occurs. Reset clears the EMITRANGE bit. PC sampling is not supported when EMITRANGE is enabled. EMITRANGE only applies for: FUNCTION = b0001, b0010, and b0011.
3:0	FUNCTION[3:0]	Function settings of the DWT Function Registers.

1.3.1439 DWT_COMP_2

DWT Comparator Registers

Use the DWT Function Registers 0-3 to control the operation of the comparator. Each comparator can: Match against either the PC or the data address. This is controlled by CYCMATCH. This function is only available for comparator 0 (DWT_COMP0). Perform data value comparisons if associated address comparators have performed an address match. This function is only available for comparator 1 (DWT_COMP1). Emit data or PC couples, trigger the ETM, or generate a watchpoint depending on the operation defined by FUNCTION.

Bits	Name	Description
24	MATCHED	This bit is set when the comparator matches, and indicates that the operation defined by FUNCTION has occurred since this bit was last read. This bit is cleared on read.
9	LNK1ENA	Read-only: 0 = DATAVADDR1 not supported 1 = DATAVADDR1 supported (enabled).

1.3.1444   DWT_FUNCTION_3 (continued)

5	EMITRANGE	Emit range field. Reserved to permit emitting offset when range match occurs. Reset clears the EMITRANGE bit. PC sampling is not supported when EMITRANGE is enabled. EMITRANGE only applies for: FUNCTION = b0001, b0010, and b0011.
3:0	FUNCTION[3:0]	Function settings of the DWT Function Registers.

1.3.1445 FPB_CTRL

Flash Patch Control Register

Reset: Reset Signals Listed Below

Register : Address

FPB_CTRL: 0xE0002000

Bits	7	6	5	4	3	2	1	0

SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the Flash Patch Control Register to enable the flash patch block.

Bits	Name	Description
14:12	NUM_CODE2[2:0]	Number of full banks of code comparators, sixteen comparators per bank. Where less than sixteen code comparators are provided, the bank count is zero, and the number present indicated by NUM_CODE. This read only field contains 3'b000 to indicate 0 banks for Cortex-M3 processor.
11:8	NUM_LIT[3:0]	Number of literal slots field. This read only field contains b0010 to indicate that there are two literal slots.
7:4	NUM_CODE1[3:0]	Number of code slots field. This read only field contains b0110 to indicate that there are six code slots.
1	KEY	Key field. To write to the Flash Patch Control Register, you must write a 1 to this write-only bit.

1.3.1445 FPB_CTRL (continued)

| 0 | ENABLE | Flash patch unit enable bit:
1 = flash patch unit enabled
0 = flash patch unit disabled.
Reset clears the ENABLE bit.
Note: If the TIEOFF_FPBEN define is uncommented in CM3Defs.v during implementation, it is not possible to set ENABLE. |

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

This register mirrors the PID/CID contents of the ROM memory table

Bits	Name	Description
7:0	CID3[7:0]	Component Identification Register 3

1.3.1467 NVIC_INT_CTL_TYPE

Interrupt Controller Type Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_INT_CTL_TYPE: 0xE000E004

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:00000				
HW Access	NA			W				
Retention	NA			RET				
Name	RSVD			INTLINESNUM				

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Read the Interrupt Controller Type Register to see the number of interrupt lines that the NVIC supports.

Bits	Name	Description
4:0	INTLINESNUM[4:0]	Total number of interrupt lines in groups of 32: b00000 = 0...32 b00001 = 33...64 b00010 = 65...96 b00011 = 97...128 b00100 = 129...160 b00101 = 161...192 b00110 = 193...224 b00111 = 225...256

1.3.1468 NVIC_SYSTICK_CTL

SYSTICK Control and Status register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_SYSTICK_CTL: 0xE000E010

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R	R	R
Retention	NA					RET	RET	RET
Name	RSVD					CLKSRC	TICKINT	ENB

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0000000							RC:0
HW Access	NA							R/W
Retention	NA							RET
Name	RSVD							CNTFLAG

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

SYSTICK Ten milliSecond software timer control and status register.

Bits	Name	Description
16	CNTFLAG	CNTFLAG is set when the CURRENT value of the SYSTICK timer is zero. It is automatically cleared when read. Note that CNTFLAG is cleared when the debugger reads it only if the MasterType bit in the AHB-AP Control Register is set to 0. Otherwise the CNTGLAG is not changed by a debugger read.
2	CLKSRC	0=External Clock Source 1=CPU Clock Note that the External Clock Source must be at least 2.5 times slower than the CPU Clock or operation will be unpredictable. If no external clock source is provided, the input is held at 1 and the SYSTICK timer will count as the same as if the CPU Clock was used.

1.3.1468   NVIC_SYSTICK_CTL (continued)

1	TICKINT	0=Disable the Systick Interrupt handler 1=Enable the Systick Interrupt Handler. When the CNTFLAG is set an interrupt will be generated if the TICKINT bit is enabled (1).
0	ENB	0=Disable the timer 1=Enable the SYSTICK Timer When the SYSTICK timer is enabled, the counter runs until it reaches 0. When it reaches 0, it will set the COUNTFLAG and load the RELOAD value into the counter and continue counting.

1.3.1469 NVIC_SYSTICK_RELOAD

SYSTICK Reload value

Reset: N/A

Register : Address

NVIC_SYSTICK_RELOAD: 0xE000E014

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R							
Retention	RET							
Name	RELOAD							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R							
Retention	RET							
Name	RELOAD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R							
Retention	RET							
Name	RELOAD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

RELOAD is copied into the CURRENT register when it counts down to 0. RELOAD is the number of clocks between each setting of the CNTFLAG in the SYSTICK_CTL register. Note that a value of 0 will not cause an interrupt or CNTFLAG to be set.

Bits	Name	Description
23:0	RELOAD[23:0]	Value loaded into the SYSTICK CURRENT value register when it counts down 0.

1.3.1470 NVIC_SYSTICK_CURRENT

SYSTICK Counter

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_SYSTICK_CURRENT: 0xE000E018

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	CURRENT							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	CURRENT							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	CURRENT							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Current value of the SYSTICK Counter. Note that writing any value to this register will clear it to zero. Clearing to zero will set CNTFLAG and reload the counter with the RELOAD value.

Bits	Name	Description
23:0	CURRENT[23:0]	Current value of the SYSTICK Counter.

1.3.1471 NVIC_SYSTICK_CAL

SYSTICK Calibration register

Reset: N/A

Register : Address

NVIC_SYSTICK_CAL: 0xE000E01C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	TENMS							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	TENMS							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	TENMS							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:U	R:U	NA:000000					
HW Access	R/W	R/W	NA					
Retention	RET	RET	NA					
Name	NOREF	SKEW	RSVD					

Used to adjust the SYSTICK timer to be exactly 10ms. See Chapter 14 of The Definitive Guide to the ARM Cortex-M3. Note: This register normally contains a fixed hardware calibration value to be used in the NVIC_SYSTICK_RELOAD register to generate a 10 ms period from a single clock source. In the PSoC architecture the SYSTICK clock can be generated from multiple sources and a wide range of frequencies. For this reason an calibration value is not supplied and the initial values in this register should not be used as a reference. User firmware may use this register to store the current calibration value and status to support an RTOS expecting values in this register.

Bits	Name	Description
31	NOREF	Set to 1 when no external reference clock is available. This is informational only and has no impact on hardware operation. The reset value of this bitfield is not valid.

1.3.1471   NVIC_SYSTICK_CAL (continued)

30	SKEW	When SKEW is set to 1, the calibration value is not exactly 10 milliseconds due to the clock frequency. The accuracy of the timer may not be suitable for Real-Time applications. If the clock period is not an integral number of 10 ms then this bit should be set. This is informational only and has no impact on hardware operation. The reset value of this bitfield is not valid.
23:0	TENMS[23:0]	Calibration value for the Ten Millisecond timer. This value is normally copied into the RELOAD register by software to achieve 10ms. If this value is read as 0 after powerup, calibration value is not available. This is informational only and has no impact on hardware operation.

1.3.1472 NVIC_SETENA0

Interrupt Enable Set 0-31

Reset: N/A

Register : Address

NVIC_SETENA0: 0xE000E100

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETENA0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETENA0							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETENA0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETENA0							

Set Enable external interrupts 0-31. Writing a 1 to any bit in this register sets the interrupt enable for the respective interrupt. Writing a 0 does nothing. To clear the bit, write a 1 to the Interrupt Clear enable register. Reading this register will read the current status of the interrupt enable. Setting and clearing the interrupt enables is done in 2 different registers to make is easier to set/clear individual bits. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
31:0	SETENA0[31:0]	Writing a 1 enables the respective interrupt. IE: bit 0 will enable IRQ0, Bit 1 will enable IRQ1 ... Bit 31 will enable IRQ31. Writing 0 has no effect.

1.3.1473 NVIC_CLRENA0

Interrupt Enable Clear 0-31

Reset: N/A

Register : Address

NVIC_CLRENA0: 0xE000E180

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRENA0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRENA0							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRENA0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRENA0							

Clear Enable external interrupts 0-31. Writing a 1 to any bit in this register clears the interrupt enable for the respective interrupt. Writing a 0 does nothing. Reading this register will read the current status of the interrupt enable. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
31:0	CLRENA0[31:0]	Writing a 1 disables the respective interrupt. IE: bit 0 will disable IRQ0, Bit 1 will disable IRQ1 ... Bit 31 will disable IRQ31. Writing 0 has no effect.

1.3.1474 NVIC_SETPEND0

Interrupt Pending Set 0-31

Reset: N/A

Register : Address

NVIC_SETPEND0: 0xE000E200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETPEND0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETPEND0							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETPEND0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	SETPEND0							

Set Pending external interrupts 0-31. Writing a 1 to any bit in this register sets the interrupt pending bit for the respective interrupt. Writing a 0 does nothing. Reading this register will read the current status of the interrupt pending bits. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
31:0	SETPEND0[31:0]	Writing a 1 sets the respective interrupt pending bit. IE: bit 0 will set IRQ0, Bit 1 will set IRQ1 ... Bit 31 will set IRQ31. Writing 0 has no effect.

1.3.1475 NVIC_CLRPEND0

Interrupt Pending Clear 0-31

Reset: N/A

Register : Address

NVIC_CLRPEND0: 0xE000E280

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRPEND0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRPEND0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	CLRPEND0							

Clear Pending external interrupts 0-31. Writing a 1 to any bit in this register clears the interrupt pending bit for the respective interrupt. Writing a 0 does nothing. Reading this register will read the current status of the interrupt pending bits. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
31:0	CLRPEND0[31:0]	Writing a 1 clears the respective interrupt pending bit. IE: bit 0 will clear IRQ0, Bit 1 will clear IRQ1 ... Bit 31 will clear IRQ31. Writing 0 has no effect.

1.3.1476 NVIC_ACTIVE0

Active Interrupts 0-31

Reset: N/A

Register : Address

NVIC_ACTIVE0: 0xE000E300

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	ACTIVE0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	ACTIVE0							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	ACTIVE0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	ACTIVE0							

Each bit of this register corresponds to an interrupt 0-31. If the bit is a 1, then that interrupt it active. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
31:0	ACTIVE0[31:0]	Active interrupt register.

1.3.1477 NVIC_PRI_0

Interrupt Priority 0-31

Reset: N/A

Register : Address

NVIC_PRI_0: 0xE000E400

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUU			NA:00000				
HW Access	R			NA				
Retention	RET			NA				
Name	PRIORITY			RSVD				

Interrupt priority for interrupts 0-31. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
7:5	PRIORITY[2:0]	There are 8 interrupt priorities. Each interrupt is assigned a single byte address for the priority register. The priority registers are stored with the Most Significant Bit (MSB) first. The priority value is stored in bits [7:5] of the byte.0 is the highest priority and 7 is the lowest.

1.3.1478 NVIC_PRI_1

Interrupt Priority 0-31

Reset: N/A

Register : Address

NVIC_PRI_1: 0xE000E401

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUU			NA:00000				
HW Access	R			NA				
Retention	RET			NA				
Name	PRIORITY			RSVD				

Interrupt priority for interrupts 0-31. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
7:5	PRIORITY[2:0]	There are 8 interrupt priorities. Each interrupt is assigned a single byte address for the priority register. The priority registers are stored with the Most Significant Bit (MSB) first. The priority value is stored in bits [7:5] of the byte.0 is the highest priority and 7 is the lowest.

1.3.1479 NVIC_PRI_2

Interrupt Priority 0-31

Reset: N/A

Register : Address

NVIC_PRI_2: 0xE000E402

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUU			NA:00000				
HW Access	R			NA				
Retention	RET			NA				
Name	PRIORITY			RSVD				

Interrupt priority for interrupts 0-31. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
7:5	PRIORITY[2:0]	There are 8 interrupt priorities. Each interrupt is assigned a single byte address for the priority register. The priority registers are stored with the Most Significant Bit (MSB) first. The priority value is stored in bits [7:5] of the byte.0 is the highest priority and 7 is the lowest.

1.3.1480 NVIC_PRI_3

Interrupt Priority 0-31

Reset: N/A

Register : Address

NVIC_PRI_3: 0xE000E403

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUU			NA:00000				
HW Access	R			NA				
Retention	RET			NA				
Name	PRIORITY			RSVD				

Interrupt priority for interrupts 0-31. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
7:5	PRIORITY[2:0]	There are 8 interrupt priorities. Each interrupt is assigned a single byte address for the priority register. The priority registers are stored with the Most Significant Bit (MSB) first. The priority value is stored in bits [7:5] of the byte.0 is the highest priority and 7 is the lowest.

1.3.1481 NVIC_PRI_4

Interrupt Priority 0-31

Reset: N/A

Register : Address

NVIC_PRI_4: 0xE000E404

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:UUU			NA:00000				
HW Access	R			NA				
Retention	RET			NA				
Name	PRIORITY			RSVD				

Interrupt priority for interrupts 0-31. See Chapter 8 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
7:5	PRIORITY[2:0]	There are 8 interrupt priorities. Each interrupt is assigned a single byte address for the priority register. The priority registers are stored with the Most Significant Bit (MSB) first. The priority value is stored in bits [7:5] of the byte.0 is the highest priority and 7 is the lowest.

Retention	RET	NA		RET	RET	RET	RET	NA
Name	NMIPEND-SET	RSVD		PENDSV-SET	PENDSV-CLR	PENDST-SET	PENDST-CLR	RSVD

Use the Interrupt Control State Register to: o set a pending Non-Maskable Interrupt (NMI)   o set or clear a pending SVC   o set or clear a pending SysTick   o check for pending exceptions   o check the vector number of the highest priority pended exception   o check the vector number of the active exception.

Bits	Name	Description
31	NMIPENDSET	On writes, makes the NMI exception active. On reads, indicates the state of the exception: 0 = On writes, has no effect. On reads, NMI is inactive. 1 = On writes, make the NMI exception active. On reads, NMI is active. Because NMI is higher priority than other exceptions, if the processor is not already executing the NMI handler, it enters the NMI exception handler as soon as it recognizes the write to this bit.

1.3.1510   NVIC_INTR_CTRL_STATE (continued)

28	PENDSVSET	Set pending pendSV bit: 1 = set pending pendSV 0 = do not set pending pendSV.
27	PENDSVCLR	Clear pending pendSV bit: 1 = clear pending pendSV 0 = do not clear pending pendSV.
26	PENDSTSET	Set a pending SysTick bit 1 = set pending SysTick 0 = do not set pending SysTick.
25	PENDSTCLR	Clear pending SysTick bit: 1 = clear pending SysTick 0 = do not clear pending SysTick.
23	ISRPREEMPT	You must only use this at debug time. It indicates that a pending interrupt becomes active in the next running cycle. If C_MASKINTS is clear in the Debug Halting Control and Status Register, the interrupt is serviced.
22	ISRPENDING	Interrupt pending flag. Excludes NMI and Faults: 1 = interrupt pending 0 = interrupt not pending.
21:12	VECTPENDING[9:0]	Pending ISR number field. VECTPENDING contains the interrupt number of the highest priority pending ISR.
11	RETTOBASE	This bit is 1 when the set of all active exceptions minus the IPSR_current_exception yields the empty set.
8:0	VECTACTIVE[8:0]	Active ISR number field. VECTACTIVE contains the interrupt number of the currently running ISR, including NMI and Hard Fault. A shared handler can use VECTACTIVE to determine which interrupt invoked it. You can subtract 16 from the VECTACTIVE field to index into the Interrupt Clear/Set Enable, Interrupt Clear Pending/SetPending and Interrupt Priority Registers. INTISR[0] has vector number 16. Reset clears the VECTACTIVE field.

1.3.1511 NVIC_VECT_OFFSET

Interrupt Vector Table Offset

Reset: N/A

Register : Address

NVIC_VECT_OFFSET: 0xE000ED08

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/W:U	NA:0000000						
HW Access	R/W	NA						
Retention	RET	NA

HW Access	NA		R/W	R/W				
Retention	NA		RET	RET				
Name	RSVD		TBLBASE	TBLOFF				

Relocates the Interrupt Vector table (IVT) to SRAM. The default Interrupt Vector Table is at 0x0000_0000 (see description in FLASH). This register allows the Vector Table to be relocated so that the interrupt vectors can be changed by the application. Typically the Interrupt Vector Table is relocated to SRAM in Code Space (below 0x2000_0000) for maximum interrupt performance. Note that the IVT can be placed above 0x2000_0000 but you lose the parallelism of stacking registers and fetching the interrupt vector at the same time if the IVT is located above 0x2000_0000. Typically the IVT should be located at the bottom of SRAM in CODE space - 0x1ffn_0000 where n will depend on the amount of SRAM available. See Chapter 7 of The Definitive Guide to the ARM Cortex-M3 for more details.

Bits	Name	Description
29	TBLBASE	Bit 29 of the vector table offset: 0=Table Base in Code. 1=Table Base in RAM. Maximum interrupt performance is achieved when this bit is 0.

1.3.1511   NVIC_VECT_OFFSET (continued)

| 28:7 | TBLOFF[21:0] | Offset of the Interrupt Vector Table. Note that this must be on a power-of-2 boundary large enough for the number of interrupt vectors (typically a 1K byte boundary). |

1.3.1512 NVIC_APPLN_INTR

Application Interrupt and Reset Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_APPLN_INTR: 0xE000ED0C

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R/W:0	R/W:0	R/W:0
HW Access	NA					R/W	R/W	R/W
Retention	NA					RET	RET	RET
Name	RSVD					SYSRESE-TREQ	VECTCL-RACTIVE	VECTRE-SET

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R/W:0	NA:0000				R/W:000		
HW Access	R/W	NA				R/W		
Retention	RET	NA				RET		
Name	ENDIAN-ESS	RSVD				PRIGROUP		

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	VECTKEY							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R/W:00000000							
HW Access	R/W							
Retention	RET							
Name	VECTKEY							

Use the Application Interrupt and Reset Control Register to: o determine data endianness   o clear all active state information for debug or to recover from a hard failure   o execute a system reset   o alter the priority grouping position (binary point).

Bits	Name	Description
31:16	VECTKEY[15:0]	Register key. Writing to this register requires 0x5FA in the VECTKEY field. Otherwise the write value is ignored.
15	ENDIANESS	Data endianness bit: 1 = big endian 0 = little endian. ENDIANESS is sampled from the BIGEND input port during reset. You cannot change ENDIANESS outside of reset.

1.3.1512   NVIC_APPLN_INTR (continued)

10:8	PRIGROUP[2:0]	Interrupt priority grouping field: PRIGROUP Split of pre-emption priority from subpriority 0 7.1 indicates seven bits of pre-emption priority, one bit of subpriority 1 6.2 indicates six bits of pre-emption priority, two bits of subpriority 2 5.3 indicates five bits of pre-emption priority, three bits of subpriority 3 4.4 indicates four bits of pre-emption priority, four bits of subpriority 4 3.5 indicates three bits of pre-emption priority, five bits of subpriority 5 2.6 indicates two bits of pre-emption priority, six bits of subpriority 6 1.7 indicates one bit of pre-emption priority, seven bits of subpriority 7 0.8 indicates no pre-emption priority, eight bits of subpriority. PRIGROUP field is a binary point position indicator for creating subpriorities for exceptions that share the same pre-emption level. It divides the PRI_n field in the Interrupt Priority Register into a pre-emption level and a subpriority level. The binary point is a left-of value. This means that the PRIGROUP value represents a point starting at the left of the Least Significant Bit (LSB). This is bit [0] of 7:0. The lowest value might not be 0 depending on the number of bits allocated for priorities, and implementation choices.
2	SYSRESETREQ	Causes a signal to be asserted to the outer system that indicates a reset is requested. Intended to force a large system reset of all major components except for debug. Setting this bit does not prevent Halting Debug from running.
1	VECTCLRACTIVE	Clear active vector bit: 1 = clear all state information for active NMI, fault, and interrupts 0 = do not clear. It is the responsibility of the application to reinitialize the stack. The VECTCLRACTIVE bit is for returning to a known state during debug. The VECTCLRACTIVE bit self-clears. IPSR is not cleared by this operation. So, if used by an application, it must only be used at the base level of activation, or within a system handler whose active bit can be set.
0	VECTRESET	System Reset bit. Resets the system, with the exception of debug components: 1 = reset system 0 = do not reset system. The VECTRESET bit self-clears. Reset clears the VECTRESET bit. For debugging, only write this bit when the core is halted.

1.3.1513 NVIC_SYSTEM_CONTROL

System Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_SYSTEM_CONTROL: 0xE000ED10

Bits	7	6	5	4	3	2	1	0

Use the System Control Register for power-management functions: o signal to the system when the processor can enter a low power state   o control how the processor enters and exits low power states.

Bits	Name	Description
4	SEVONPEND	When enabled, this causes WFE to wake up when an interrupt moves from inactive to pended. Otherwise, WFE only wakes up from an event signal, external and SEV instruction generated. The event input, RXEV, is registered even when not waiting for an event, and so effects the next WFE.
2	SLEEPDEEP	Sleep deep bit: 1 = indicates to the system that Cortex-M3 clock can be stopped. Setting this bit causes the SLEEPDEEP port to be asserted when the processor can be stopped. 0 = not OK to turn off system clock.

1.3.1513   NVIC_SYSTEM_CONTROL (continued)

| 1 | SLEEPONEXIT | Sleep on exit when returning from Handler mode to Thread mode:
1 = sleep on ISR exit.
0 = do not sleep when returning to Thread mode.
Enables interrupt driven applications to avoid returning to empty main application. |

1.3.1514 NVIC_CFG_CONTROL

Configuration Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_CFG_CONTROL: 0xE000ED14

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R/W:0	R/W:0	NA:0	R/W:0	R/W:0

Retention	NA							
Name	RSVD							

Use the Configuration Control Register to: o enable NMI, Hard Fault and FAULTMASK to ignore bus fault   o trap divide by zero, and unaligned accesses   o enable user access to the Software Trigger Exception Register   o control entry to Thread Mode.

Bits	Name	Description
9	STKALIGN	1 = on exception entry, the SP used prior to the exception is adjusted to be 8-byte aligned and the context to restore it is saved. The SP is restored on the associated exception return. 0 = only 4-byte alignment is guaranteed for the SP used prior to the exception on exception entry.

1.3.1514 NVIC_CFG_CONTROL (continued)

8	BFHFNMIGN	When enabled, this causes handlers running at priority -1 and -2 (Hard Fault, NMI, and FAULT-MASK escalated handlers) to ignore Data Bus faults caused by load and store instructions. When disabled, these bus faults cause a lock-up. You must only use this enable with extreme caution. All data bus faults are ignored - you must only use it when the handler and its data are in absolutely safe memory. Its normal use is to probe system devices and bridges to detect control path problems and fix them.
4	DIV_0_TRP	Trap on Divide by 0. This enables faulting/halting when an attempt is made to divide by 0.
3	UNALIGN_TRP	Trap for unaligned access. This enables faulting/halting on any unaligned half or full word access. Unaligned load-store multiples always fault.
1	USERSETMPEND	If written as 1, enables user code to write the Software Trigger Interrupt register to trigger (pend) a Main exception, which is one associated with the Main stack pointer.
0	NONEBASETHRDENA	When 0, default, It is only possible to enter Thread mode when returning from the last exception. When set to 1, Thread mode can be entered from any level in Handler mode by controlled return value.

1.3.1515 NVIC_SYS_PRIO_HANDLER_4_7

System Handler Priority Registers

Reset: System reset for retention flops [reset_all_retention]

Name	RSVD							

Use the System Handler Control and State Register to: o enable or disable the system handlers o determine the pending status of bus fault, mem manage fault, and SVC o determine the active status of the system handlers. o If a fault condition occurs while its fault handler is disabled, the fault escalates to a Hard Fault.

Bits	Name	Description
18	USGFAULTENA	Enable for UsageFault. Set to 0 to disable, else 1 for enabled.
17	BUSFAULTENA	Enable for BusFault. Set to 0 to disable, else 1 for enabled.
16	MEMFAULTENA	Enable for MemManage fault. Set to 0 to disable, else 1 for enabled.
15	SVCALLPENDED	Reads as 1 if SVCall is pending.

1.3.1518   NVIC_SYS_HANDLER_CSR (continued)

14	BUSFAULTPENDED	Reads as 1 if BusFault is pending.
13	MEMFAULTPENDED	Reads as 1 if MemManage is pending.
12	USGFAULTPENDED	Read as 1 if usage fault is pending.
11	SYSTICKACT	Reads as 1 if SysTick is active.
10	PENDSVACT	Reads as 1 if PendSV is active.
8	MONITORACT	Reads as 1 if the Monitor is active.
7	SVCALLACT	Reads as 1 if SVCall is active.
3	USGFAULTACT	Reads as 1 if UsageFault is active.
1	BUSFAULTACT	Reads as 1 if BusFault is active.
0	MEMFAULTACT	Reads as 1 if MemManage is active.

1.3.1519 NVIC_MEMMAN_FAULT_STATUS

Memory Manage Fault Status Registers.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_MEMMAN_FAULT_STATUS: 0xE000ED28

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:0	NA:00		R/WOC:0	R/WOC:0	NA:0	R/WOC:0	R/WOC:0
HW Access	R/W	NA		R/W	R/W	NA	R/W	R/W
Retention	RET	NA		RET	RET	NA	RET	RET
Name	MMARVAL-ID	RSVD		MSTKERR	MUNST-KERR	RSVD	DACCVIOL	IACCVIOL

The flags in the Memory Manage Fault Status Register indicate the cause of memory access faults.

Bits	Name	Description
7	MMARVALID	Memory Manage Address Register (MMAR) address valid flag: 1 = valid fault address in MMAR. A later-arriving fault, such as a bus fault, can clear a memory manage fault. 0 = no valid fault address in MMAR. If a MemManage fault occurs that is escalated to a Hard Fault because of priority, the Hard Fault handler must clear this bit. This prevents problems on return to a stacked active MemManage handler whose MMAR value has been overwritten.
4	MSTKERR	Stacking from exception has caused one or more access violations. The SP is still adjusted and the values in the context area on the stack might be incorrect. The MMAR is not written.
3	MUNSTKERR	Unstack from exception return has caused one or more access violations. This is chained to the handler, so that the original return stack is still present. SP is not adjusted from failing return and new save is not performed. The MMAR is not written.
1	DACCVIOL	Data access violation flag. Attempting to load or store at a location that does not permit the operation sets the DACCVIOL flag. The return PC points to the faulting instruction. This error loads MMAR with the address of the attempted access.
0	IACCVIOL	Instruction access violation flag. Attempting to fetch an instruction from a location that does not permit execution sets the IACCVIOL flag. This occurs on any access to an XN region, even when the MPU is disabled or not present. The return PC points to the faulting instruction. The MMAR is not written.

1.3.1520 NVIC_BUS_FAULT_STATUS

Bus Fault Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_BUS_FAULT_STATUS: 0xE000ED29

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R/WOC:0	NA:00		R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0	R/WOC:0
HW Access	R/W	NA		R/W	R/W	R/W	R/W	R/W
Retention	RET	NA		RET	RET	RET	RET	RET
Name	BFARVALID	RSVD		STKERR	UNSTKERR	IMPRE-CISERR	PRE-CISERR	IBUSERR

The flags in the Bus Fault Status Register indicate the cause of bus access faults.

Bits	Name	Description
7	BFARVALID	This bit is set if the Bus Fault Address Register (BFAR) contains a valid address. This is true after a bus fault where the address is known. Other faults can clear this bit, such as a MemManage fault occurring later. If a Bus fault occurs that is escalated to a Hard Fault because of priority, the Hard Fault handler must clear this bit. This prevents problems if returning to a stacked active Bus fault handler whose BFAR value has been overwritten.
4	STKERR	Stacking from exception has caused one or more bus faults. The SP is still adjusted and the values in the context area on the stack might be incorrect. The BFAR is not written.
3	UNSTKERR	Unstack from exception return has caused one or more bus faults. This is chained to the handler, so that the original return stack is still present. SP is not adjusted from failing return and new save is not performed. The BFAR is not written.
2	IMPRECISERR	Imprecise data bus error. It is a BusFault, but the Return PC is not related to the causing instruction. This is not a synchronous fault. So, if detected when the priority of the current activation is higher than the Bus Fault, it only pends. Bus fault activates when returning to a lower priority activation. If a precise fault occurs before returning to a lower priority exception, the handler detects both IMPRECISERR set and one of the precise fault status bits set at the same time. The BFAR is not written.
1	PRECISERR	Precise data bus error return.
0	IBUSERR	Instruction bus error flag: 1 = instruction bus error 0 = no instruction bus error. The IBUSERR flag is set by a prefetch error. The fault stops on the instruction, so if the error occurs under a branch shadow, no fault occurs. The BFAR is not written.

1.3.1521 NVIC_USAGE_FAULT_STATUS

Usage Fault Status Register

Reset: System reset for retention flops [reset_all_retention]

The flags in the Usage Fault Status Register indicate the following errors: o illegal combination of EPSR and instruction   o illegal PC load   o illegal processor state   o instruction decode error   o attempt to use a coprocessor instruction   o illegal unaligned access.

Bits	Name	Description
9	DIVBYZERO	When DIV_0_TRP (see Configuration Control Register) is enabled and an SDIV or UDIV instruction is used with a divisor of 0, this fault occurs The instruction is executed and the return PC points to it. If DIV_0_TRP is not set, then the divide returns a quotient of 0.
8	UNALIGNED	When UNALIGN_TRP is enabled (see Configuration Control Register), and there is an attempt to make an unaligned memory access, then this fault occurs. Unaligned LDM/STM/LDRD/STRD instructions always fault irrespective of the setting of UNALIGN_TRP.
3	NOCP	Attempt to use a coprocessor instruction. The processor does not support coprocessor instructions.
2	INVPC	Attempt to load EXC_RETURN into PC illegally. Invalid instruction, invalid context, invalid value. The return PC points to the instruction that tried to set the PC.
1	INVSTATE	Invalid combination of EPSR and instruction, for reasons other than UNDEFINED instruction. Return PC points to faulting instruction, with the invalid state.
0	UNDEFINSTR	The UNDEFINSTR flag is set when the processor attempts to execute an undefined instruction. This is an instruction that the processor cannot decode. The return PC points to the undefined instruction.

1.3.1522 NVIC_HARD_FAULT_STATUS

Hard Fault Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_HARD_FAULT_STATUS: 0xE000ED2C

HW Access	R/W	R/W	NA					
Retention	RET	RET	NA					
Name	DEBUGEVT	FORCED	RSVD					

Use the Hard Fault Status Register (HFSR) to obtain information about events that activate the Hard Fault handler.

Bits	Name	Description
31	DEBUGEVT	This bit is set if there is a fault related to debug. This is only possible when halting debug is not enabled. For monitor enabled debug, it only happens for BKPT when the current priority is higher than the monitor. When both halting and monitor debug are disabled, it only happens for debug events that are not ignored (minimally, BKPT). The Debug Fault Status Register is updated.
30	FORCED	Hard Fault activated because a Configurable Fault was received and cannot activate because of priority or because the Configurable Fault is disabled. The Hard Fault handler then has to read the other fault status registers to determine cause.
1	VECTTB	This bit is set if there is a fault because of vector table read on exception processing (Bus Fault). This case is always a Hard Fault. The return PC points to the pre-empted instruction.

1.3.1523 NVIC_DEBUG_FAULT_STATUS

Debug Fault Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

NVIC_DEBUG_FAULT_STATUS: 0xE000ED30

Bits	7	6	5	4	3	2	1	0

HW Access	NA							
Retention	NA							
Name	RSVD							

Use the Debug Fault Status Register to monitor: o external debug requests   o vector catches   o data watchpoint match   o BKPT instruction execution   o alt requests.   Multiple flags in the Debug Fault Status Register can be set when multiple fault conditions occur. The register is read/write clear. This means that it can be read normally. Writing a 1 to a bit clears that bit.

Bits	Name	Description
4	EXTERNAL	External debug request flag: 1 = EDBGRQ signal asserted 0 = EDBGRQ signal not asserted. The processor stops on next instruction boundary.
3	VCATCH	Vector catch flag: 1 = vector catch occurred 0 = no vector catch occurred. When the VCATCH flag is set, a flag in one of the local fault status registers is also set to indicate the type of fault.

1.3.1523   NVIC_DEBUG_FAULT_STATUS (continued)

2	DWTTRAP	Data Watchpoint and Trace (DWT) flag: 1 = DWT match 0 = no DWT match. The processor stops at the current instruction or at the next instruction.
1	BKPT	BKPT flag: 1 = BKPT instruction execution 0 = no BKPT instruction execution. The BKPT flag is set by a BKPT instruction in flash patch code, and also by normal code. Return PC points to breakpoint containing instruction.
0	HALTED	Halt request flag: 1 = halt requested by NVIC, including step. The processor is halted on the next instruction. 0 = no halt request.

1.3.1524 NVIC_MEMMAN_FAULT_ADD

Memory Manage Fault Address Register

Reset: N/A

Register : Address

NVIC_MEMMAN_FAULT_ADD: 0xE000ED34

Bits	7	6	5	4	3	2	1	0

SW Access:Reset	R/W:UUUUUUUU							
HW Access	R/W							
Retention	RET							
Name	ADDRESS							

Use the Memory Manage Fault Address Register to read the address of the location that caused a Memory Manage Fault.

Bits	Name	Description
31:0	ADDRESS[31:0]	Mem Manage fault address field. ADDRESS is the data address of a faulted load or store attempt. When an unaligned access faults, the address is the actual address that faulted. Because an access can be split into multiple parts, each aligned, this address can be any offset in the range of the requested size. Flags in the Memory Manage Fault Status Register indicate the cause of the fault.

1.3.1525 NVIC_BUS_FAULT_ADD

Bus Fault Address Register

Reset: N/A

Register : Address

NVIC_BUS_FAULT_ADD: 0xE000ED38

HW Access	NA						R/W	R/W
Retention	NA						RET	RET
Name	RSVD						S_RESET_ ST	S_RETIRE_ ST

The purpose of the Debug Halting Control and Status Register (DHCSR) is to: o provide status information about the state of the processor   o enable core debug   o halt and step the processor.   NOTE: Bits[31:16] have a seperate write path. Debug Key. 0xA05F must be written whenever this register is written. Reads back as status bits [25:16]. If not written as Key, the write operation is ignored and no bits are written into the register.

Bits	Name	Description
25	S_RESET_ST	Indicates that the core has been reset, or is now being reset, since the last time this bit was read. This a sticky bit that clears on read. So, reading twice and getting 1 then 0 means it was reset in the past. Reading twice and getting 1 both times means that it is being reset now (held in reset still).

1.3.1526   **CORE_DBG_DBG_HLT_CS** (continued)

24	S_RETIRE_ST	Indicates that an instruction has completed since last read. This is a sticky bit that clears on read. This determines if the core is stalled on a load/store or fetch.
19	S_LOCKUP	Reads as one if the core is running (not halted) and a lockup condition is present.
18	S_SLEEP	Indicates that the core is sleeping (WFI, WFE or SLEEP-ON-EXIT). Must use C_HALT to gain control or wait for interrupt to wake-up.
17	S_HALT	The core is in debug state when S_HALT is set.
16	S_REGRDYG	Register Read/Write on the Debug Core Register Selector register is available. Last transfer is complete.
5	C_SNAPSTALL	If the core is stalled on a load/store operation the stall ceases and the instruction is forced to complete. This enables Halting debug to gain control of the core. It can only be set if: C_DEBUGEN = 1 C_HALT = 1 The core reads S_RETIRE_ST as 0. This indicates that no instruction has advanced. This prevents misuse. The bus state is Unpredictable when this is used. S_RETIRE can detect core stalls on load/store operations.
3	C_MASKINTSK	Mask interrupts when stepping or running in halted debug. Does not affect NMI, which is not maskable. Must only be modified when the processor is halted (S_HALT == 1).
2	C_STEP	Steps the core in halted debug. When C_DEBUGEN = 0, this bit has no effect. Must only be modified when the processor is halted (S_HALT == 1).
1	C_HALT	Halts the core. This bit is set automatically when the core Halts. For example Breakpoint. This bit clears on core reset. This bit can only be written if C_DEBUGEN is 1, otherwise it is ignored. When setting this bit to 1, C_DEBUGEN must also be written to 1 in the same value (value[1:0] is 2'b11). The core can halt itself, but only if C_DEBUGEN is already 1 and only if it writes with b11).
0	C_DEBUGEN	Enables debug. This can only be written by AHB-AP and not by the core. It is ignored when written by the core, which cannot set or clear it. The core must write a 1 to it when writing C_HALT to halt itself.

1.3.1527 CORE_DBG_DBG_REG_SEL

Debug Core Register Selector Register

Reset: N/A

Register : Address

CORE_DBG_DBG_REG_SEL: 0xE000EDF4

Bits	7	6	5	4	3	2	1	0

The purpose of the Debug Core Register Selector Register (DCRSR) is to select the processor register to transfer data to or from. This write-only register generates a handshake to the core to transfer data to or from Debug Core Register Data Register and the selected register. Until this core transaction is complete, bit[16], S_REGRDY, of the DHCSR is 0. NOTE: o Writes to this register in any size but word are Unpredictable. o PSR registers are fully accessible this way, whereas some read as 0 when using MSR instructions. o All bits can be written, but some combinations cause a fault when execution is resumed. o IT might be written and behaves as though in an IT block. o ICI can be written, though invalid values or when not used on an LDM/STM causes a fault, as would on return from exception. changing ICI from a value to 0 causes the underlying LDM/STM to start, not continue.

Bits	Name	Description
16	REGWnR	Write = 1 Read = 0

1.3.1527   **CORE_DBG_DBG_REG_SEL** (continued)

The purpose of the Debug Core Register Data Register (DCRDR) is to hold data for reading and writing registers to and from the processor. This is the data value written to the register selected by the DCRSR. When the processor receives a request from the DCRS, this register is read or written by the processor using a normal load-store unit operation. If core register transfers are not being performed, software-based debug monitors can use this register for communication in non-halting debug.

Bits	Name	Description
31:0	DATA[31:0]	(no description)

HW Access	NA							R
Retention	NA							RET
Name	RSVD							TRCENA

The purpose of the Debug Exception and Monitor Control Register (DEMCR) is: o Vector catching. That is, to cause debug entry when a specified vector is committed for execution. o Debug monitor control.

Bits	Name	Description
24	TRCENA	This bit must be set to 1 to enable use of the trace and debug blocks: o Data Watchpoint and Trace (DWT) o Instrumentation Trace Macrocell (ITM) o Embedded Trace Macrocell (ETM) o Trace Port Interface Unit (TPIU). This enables control of power usage unless tracing is required. The application can enable this, for ITM use, or use by a debugger.

1.3.1529   CORE_DBG_EXC_MON_CTL (continued)

19	MON_REQ	This enables the monitor to identify how it wakes up: 1 = woken up by MON_PEND 0 = woken up by debug exception.
18	MON_STEP	When MON_EN = 1, this steps the core. When MON_EN = 0, this bit is ignored. This is the equivalent to C_STEP. Interrupts are only stepped according to the priority of the monitor and settings of PRIMASK, FAULTMASK, or BASEPRI.
17	MON_PEND	Pend the monitor to activate when priority permits. This can wake up the monitor through the AHB-AP port. It is the equivalent to C_HALT for Monitor debug. This register does not reset on a system reset. It is only reset by a power-on reset. Software in the reset handler or later, or by the DAP must enable the debug monitor.
16	MON_EN	Enable the debug monitor. When enabled, the System handler priority register controls its priority level. If disabled, then all debug events go to Hard fault. C_DEBUGEN in the Debug Halting Control and Statue register overrides this bit. Vector catching is semi-synchronous. When a matching event is seen, a Halt is requested. Because the processor can only halt on an instruction boundary, it must wait until the next instruction boundary. As a result, it stops on the first instruction of the exception handler. However, two special cases exist when a vector catch has triggered: o If a fault is taken during vectoring, vector read or stack push error, the halt occurs on the corresponding fault handler, for the vector error or stack push. o If a late arriving interrupt comes in during vectoring, it is not taken. That is, an implementation that supports the late arrival optimization must suppress it in this case.
10	VC_HARDERRR	Debug trap on Hard Fault.
9	VC_INTERR	Debug Trap on interrupt/exception service errors. These are a subset of other faults and catches before BUSERR or HARDERR.
8	VC_BUSERR	Debug Trap on normal Bus error.
7	VC_STATERR	Debug trap on Usage Fault state errors.
6	VC_CHKERR	Debug trap on Usage Fault enabled checking errors.
5	VC_NOCPERRC	Debug trap on Usage Fault access to Coprocessor which is not present or marked as not present in CAR register.
4	VC_MMERRM	Debug trap on Memory Management faults.
0	VC_CORERESET	Reset Vector Catch. Halt running system if Core reset occurs.

1.3.1530 TPIU_SUPPORTED_SYNC_PRT_SZ

Supported Sync Port Sizes Register

Reset: System reset for retention flops [reset_all_retention]

Name	RSVD							

This register is read/write. Each bit location represents a single port size that is supported on the device, that is, 4, 2 or 1 in bit locations [3:0]. If the bit is set then that port size is permitted. By default the RTL is designed to support all port sizes, set to 0x0000000B. This register is constrained by the input tie-off MAXPORTSIZE. The external tie-off, MAXPORTSIZE, must be set during finalization of the ASIC to reflect the actual number of TRACEDATA signals wired to physical pins. This is to ensure that tools do not attempt to select a port width that an attached TPA cannot capture. The value on MAXPORTSIZE causes bits within the Supported Port Size register that represent wider widths to be clear, that is, unsupported.

Bits	Name	Description
3:0	SUPPORTED_SYNC_PRT_SZ[3:0]	Port size

1.3.1531 TPIU_CURRENT_SYNC_PRT_SZ

Current Sync Port Size Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_CURRENT_SYNC_PRT_SZ: 0xE0040004

HW Access	NA							
Retention	NA							
Name	RSVD							

This register is read/write. The Current Sync Port Size Register has the same format as the Supported Sync Port Sizes Register but only one bit is set, and all others must be zero. Writing values with more than one bit set, or setting a bit that is not indicated as supported is not supported and causes Unpredictable behavior.   It is more convenient to use the same format as the Supported Sync Port Sizes Register because it saves on having to decode the sizes later on in the device, and also maintains the format from the other register bank for checking for valid assignments.   On reset this defaults to the smallest possible port size, 1 bit, and so reads as 0x00000001.

Bits	Name	Description
3:0	CURRENT_SYNC_PRT_SZ[3:0]	Port size

1.3.1532 TPIU_ASYNC_CLK_PRESCALER

Async Clock Prescaler Register

SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Formatter and Flush Status Register.

Bits	Name	Description
3	FtNonStop	Formatter cannot be stopped
2	TCPresent	This bit always reads zero
1	FtStopped	This bit always reads zero
0	FlInProg	This bit always reads zero

1.3.1535 TPIU_FORM_FLUSH_CTRL

Formatter and Flush Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_FORM_FLUSH_CTRL: 0xE0040304

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:1	NA:0
HW Access	NA						R	NA
Retention	NA						RET	NA
Name	RSVD						EnFCont	RSVD

HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Formatter and Flush Control Register.

Bits	Name	Description
8	TrigIN	Indicate a trigger on TRIGIN being asserted. This bit Reads-As-One (RAO), specifying that triggers are inserted when a trigger pin is asserted.
1	EnFCont	Continuous Formatting, no TRACECTL. This bit is set on reset. Note: If TPIU_PROTOCOL is set to select Parallel Port Mode, the formatter is automatically enabled. If you then select one of the SWO modes, TPIU_FORM_FLUSH_CTRL reverts to its previously programmed value.

1.3.1536 TPIU_TRIGGER

Integration test of the TRIGGER input.

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_TRIGGER: 0xE0040EE8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:0
HW Access	NA							R
Retention	NA							RET

SW Access:Reset	NA:00		R:0	R:00		R:0	R:00	
HW Access	NA		R	R		R	R	
Retention	NA		RET	RET		RET	RET	
Name	RSVD		ITM_ATVAL ID	ITM_ByteCount		ETM_ATVA LID	ETM_ByteCount	

Trace data integration testing. You must set bit [1] of TPIU_ITCTRL to use this register.

Bits	Name	Description
29	ITM_ATVALID	Returns the value of the ITM ATVALID signal.
28:27	ITM_ByteCount[1:0]	Number of bytes of ITM trace data since last read of Integration ITM Data Register.
26	ETM_ATVALID	Returns the value of the ETM ATVALID signal.
25:24	ETM_ByteCount[1:0]	Number of bytes of ETM trace data since last read of Integration ETM Data Register.
23:16	ETM_Data2[7:0]	ETM trace data. The TPIU discards this data when the register is read.
15:8	ETM_Data1[7:0]	ETM trace data. The TPIU discards this data when the register is read.
7:0	ETM_Data0[7:0]	ETM trace data. The TPIU discards this data when the register is read.

1.3.1538 TPIU_ITATBCTR2

Integration Test Registers

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_ITATBCTR2: 0xE0040EF0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R/W:0
HW Access	NA							R
Retention	NA							RET
Name	RSVD							ATREADY1

SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Use the Integration Test Registers to perform topology detection of the TPIU with other devices in a Cortex-M3 system. These registers enable direct control of outputs and the ability to read the value of inputs. You must set bit [1] of TPIU_ITCTRL to use this register

Bits	Name	Description
0	ATREADY1	This bit reads or sets the value of ATREADYS1 and ATREADYS2.

1.3.1539 TPIU_ITATBCTR0

Integration Test Registers

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_ITATBCTR0: 0xE0040EF8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:0
HW Access	NA							R/W

HW Access	NA		R	R		R	R	
Retention	NA		RET	RET		RET	RET	
Name	RSVD		ITM_ATVALID	ITM_ByteCount		ETM_ATVALID	ETM_ByteCount	

Trace data integration testing. You must set bit [1] of TPIU_ITCTRL to use this register.

Bits	Name	Description
29	ITM_ATVALID	Returns the value of the ITM ATVALID signal.
28:27	ITM_ByteCount[1:0]	Number of bytes of ITM trace data since last read of Integration ITM Data Register.
26	ETM_ATVALID	Returns the value of the ETM ATVALID signal.
25:24	ETM_ByteCount[1:0]	Number of bytes of ETM trace data since last read of Integration ETM Data Register.
23:16	ITM_Data2[7:0]	ITM trace data. The TPIU discards this data when the register is read.
15:8	ITM_Data1[7:0]	ITM trace data. The TPIU discards this data when the register is read.
7:0	ITM_Data0[7:0]	ITM trace data. The TPIU discards this data when the register is read.

1.3.1541 TPIU_ITCTRL

Integration Mode Control

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_ITCTRL: 0xE0040F00

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000000						R/W:00	
HW Access	NA						R	
Retention	NA						RET	
Name	RSVD						Mode	

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16

Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Specifies normal or integration mode for the TPIU.

Bits	Name	Description
1:0	Mode[1:0]	Specifies the current mode for the TPIU: 0b00 normal mode 0b01 integration test mode 0b10 integration data test mode 0b11 Reserved. In integration data test mode, the trace output is disabled, and data can be read directly from each input port using the integration data registers.

1.3.1542 TPIU_DEVID

TPIU Provided Function Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_DEVID: 0xE0040FC8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:10		R:1	R:00001				
HW Access	R		R	R				
Retention	RET		RET	RET				
Name	MinBufSize		Async-TRACE-CLKIN	NumTraceInp				

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:0000				R:1	R:1	R:0	R:0
HW Access	NA				R	R	R	R
Retention	NA				RET	RET	RET	RET
Name	RSVD				AsyncS-WONRZ	AsyncS-WOMan	ParTrace-Mode	MinBufSize

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Indicates the functions provided by the TPIU for use in topology detection.

Bits	Name	Description
11	AsyncSWONRZ	Asynchronous Serial Wire Output (NRZ). This bit Reads-As-One (RAO), indicating that the output is supported.
10	AsyncSWOMan	Asynchronous Serial Wire Output (Manchester). This bit Reads-As-One (RAO), indicating that the output is supported.
9	ParTraceMode	Parallel trace port mode. This bit Reads-As-Zero (RAZ), indicating that parallel trace port mode is supported.
8:6	MinBufSize[2:0]	Minimum buffer size. Specifies the minimum TPIU buffer size: 0b010 = 4 bytes.

1.3.1542   TPIU_DEVID (continued)

5	AsyncTRACECLKIN	Specifies whether TRACECLKIN can be asynchronous to CLK: 0b1 = TRACECLKIN can be asynchronous to CLK.
4:0	NumTraceInp[4:0]	Specifies the number of trace inputs: 0b000000 = 1 input 0b000001 = 2 inputs Since our implementation includes an ETM, the value of this field is 0b00001.

1.3.1543 TPIU_DEVTYPE

TPIU Device Type Identifier Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

TPIU_DEVTYPE: 0xE0040FCC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:0001				R:0001			
HW Access	R				R			
Retention	RET				RET			
Name	SubType				MajorType			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16

Name	RSVD			TIMESTAM P_ENABLE	RSVD			

ETM control register controls general operation of the ETM, such as whether tracing is enabled.

Bits	Name	Description
28	TIMESTAMP_ENABLE	When set, this bit enables timestamping. An ETM reset sets this bit to 0.
21	PRT_SIZE3	These bits are implemented but have no function.On an ETM reset this bit is 0.
17:16	PRT_MODE10[1:0]	These bits are implemented but have no function. On ETM reset these bits are cleared to 0.
13	PRT_MODE2	This bit is implemented but has no function. On an ETM reset this bit is 0.

1.3.1556   ETM_CTL (continued)

11	PRT_SEL	This bit controls the external ETMEN pin. The possible values are: 0 ETMEN is LOW. 1 ETMEN is HIGH. This bit must be set by the trace software tools to ensure that trace output is enabled from this ETM. ETMEN can be used to enable the trace port pins to be shared with GPIO pins under the control of logic external to the ETM. On an ETM reset this bit is 0.
10	PROG	When set to 1, the ETM is being programmed. On an ETM reset this bit is set to b1.
9	DBGRQ_CTL	When set to 1 and the trigger event occurs, the DBGRQ output is asserted until DBGACK is observed. This enables the ARM processor to be forced into Debug state. On an ETM reset this bit is 0.
8	BRNCH_OUT	When set to 1 all branch addresses are output, even if the branch was because of a direct branch instruction. Setting this bit enables reconstruction of the program flow without having access to the memory image of the code being executed. On an ETM reset this bit is 0.
7	STALL_uP	The FIFOFULL output can be used to stall the processor to prevent overflow. This signal is only enabled when the stall processor bit is set to 1. When this bit is 0 the FIFOFULL output remains LOW at all times and the FIFO overflows if there are too many trace packets. On an ETM reset this bit is 0. If the FIFOFULL signal is not implemented then this bit reads as zero and ignores writes.
6:4	PRT_SIZE[2:0]	The port size determines how many external pins are available to output the trace information. In ETMv1 and ETMv2 the port size is the number of bits in TRACEPKT. In ETMv3 the port size is the number of bits in TRACEDATA. This configuration determines how quickly the trace packets are extracted from the FIFO. From ETMv3 the port size field is 4 bits wide and bits [6:4] must be used in conjunction with bit [21], so that the port size encoding is given by bits [21, 6:4]. On an ETM reset these bits correspond to the lowest supported port width.
0	PD	A pin controlled by this bit enables the ETM power to be controlled externally. The external pin is often ETMPWRDOWN or inverted as ETMPWRUP. This bit must be cleared by the trace software tools at the beginning of a debug session.When this bit is set to 1, the ETM must be powered down and disabled, and then operated in a low power mode with all clocks stopped. When this bit is set to 1, writes to some registers and fields might be ignored. You can always write to the following registers and fields: o ETM Control Register, bit [0] and bits [27:25] o Lock Access Register o Claim Tag Set Register o Claim Tag Clear Register o Operating System Lock Access Register. o When the ETM Control Register is written with this bit set to 1, bits other than bit [0] and bits [27:25] might be ignored. On an ETM reset this bit is set to 1.

1.3.1557 ETM_CFG_CODE

ETM Configuration code register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_CFG_CODE: 0xE0041004

The ETM Configuration Code Register enables the debugger to read the IMPLEMENTATION DEFINED configuration of the ETM, giving the number of each type of resource. Where a value indicates the number of instances of a particular resource, zero indicates that there are no implemented resources of that resource type.

Bits	Name	Description
31	ETM_ID	When set to 1, this bit indicates that the ETM ID Register, 0x79, is present and defines the ETM architecture version in use. When set to 0, this bit indicates that the ETM ID Register is not present.
27	COPRC_SUPPORT	Coprocessor or memory-mapped access to registers supported.
26	TRACE_START_STOP	When set to 1, the trace start/stop block is present.
25:24	CTXTID_CMP[1:0]	Number of Context ID comparators.

1.3.1557 ETM_CFG_CODE (continued)

23	FIFOFULL_LGC	When set to 1, the FIFOFULL logic is present. This bit is used in conjunction with bit [8] of the System Configuration Register, register 0x05, of the processor core connected to the ETM.
22:20	EXT_OUT[2:0]	Number of external outputs.
19:17	EXT_IN[2:0]	Number of external inputs.
16	SEQ	When set to b1 the sequencer is present.
15:13	COUNTERS[2:0]	Number of counters.
12:8	MMD_INPUT[4:0]	Number of memory map decoder inputs.
7:4	DATA_CMPS[3:0]	Number of data value comparators.
3:0	ADD_CMPS[3:0]	Number of pairs of address comparators.

1.3.1558 ETM_TRIG_EVENT

Trigger Event Register

Reset:　　　System reset for retention flops [reset_all_retention]

Name	RSVD							

The ETM Status Register provides information about the current status of the trace and trigger logic.

Bits	Name	Description
3	TRIG_BIT	Trigger bit. Set when the trigger occurs, and prevents the trigger from being output until the ETM is next programmed.
2	TRACE_STATUS	Holds the current status of the trace start/stop resource. If set to 1, it indicates that a trace on address has been matched, without a corresponding trace off address match.

1.3.1559   ETM_STATUS (continued)

1	PROG_BIT	The current effective value of the ETM Programming bit (ETM Control Register bit [10]). You must wait for this bit to go to 1 before you start to program the ETM. If you read other bits in the ETM Status Register while this bit is 0, some instructions might not have taken effect. It is recommended that you set the ETM Programming bit and wait for this bit to go to 1 before reading the overflow bit.In ETMv3.2 and later this bit remains 0 if there is any data in the FIFO. This ensures that the FIFO is empty before the ETM programming is changed.
0	OVERFLOW_FLAG	If set to 1, there is an overflow that has not yet been traced. This bit is cleared to 0 when either: o trace is restarted. o the ETM Power Down bit, bit [0] of the ETM Control Register, 0x00, is set to 1.

1.3.1560 ETM_SYS_CFG

System Configuration Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_SYS_CFG: 0xE0041014

HW Access	NA							
Retention	NA							
Name	RSVD							

The System Configuration Register shows the ETM features supported by the ASIC. The contents of this register are based on inputs provided by the ASIC.

Bits	Name	Description
17	NO_FETCH_CMP	No Fetch comparisons. The value of this bit is 1, indicating that fetch comparisons are not implemented.
14:12	CORE_SUPPORT[2:0]	Number of supported cores minus 1. The value given here is the maximum value that can be written to bits [27:25] of the ETM Control Register, 0x00. These bits must be b000 if JTAG access is supported.
11	PRT_MODE_SUPPORT	Port mode supported. Set to 1 if the currently selected port mode is supported internally or externally.

1.3.1560   ETM_SYS_CFG (continued)

10	PRT_SIZE_SUPPORT	Port size supported. Set to 1 if the currently selected port size is supported internally or externally for the currently selected port mode. Enables more complex port sizes to be supported.
9	MAX_PRT_SIZE3	Maximum port size[3]. This bit is used in conjunction with bits [2:0]. Its value is 0. This has no effect on the TPIU trace port.
8	FIFOFULL_SUPPORT	If set to 1, FIFOFULL is supported. This bit is used in conjunction with bit [23] of the ETM Configuration Register.
3	RESERVED	Reserved, but reads as 1
2:0	MAX_PRT_SIZE[2:0]	Maximum port size[2:0]. This bit is used in conjunction with bit [9]. The value given here is the maximum size supported by both the ETM and the ASIC. Smaller sizes might or might not be supported. Check bit [10] for precise details of supported modes.

1.3.1561 ETM_TRACE_ENB_EVENT

Trace Enable Event Register

HW Access	NA							
Retention	NA							
Name	RSVD							

The FIFOFULL Level Register holds the level below which the FIFO is considered full, although its function varies for different ETM architectures. From ETMv3.0 the value in this register also controls the point at which data trace suppression occurs.

Bits	Name	Description
4:0	FIFOFULL_LVL[4:0]	The number of bytes left in the FIFO, below which the FIFOFULL or SuppressData signal is asserted. For example, setting this value to 15 causes data trace suppression or processor stalling, if enabled, when there are less than 15 free bytes in the FIFO.

1.3.1564 ETM_SYNC_FREQ

Synchronization Frequency Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

HW Access	R				R			
Retention	RET				RET			
Name	CoreFam				MajorETMArchVer			

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:000			R:1	R:0	R:1	NA:0	R:0
HW Access	NA			R	R	R	NA	R
Retention	NA			RET	RET	RET	NA	RET
Name	RSVD			BrPcktEnc	TrustZone-Supp	Thumb2Supp	RSVD	LoadPC-First

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:01000001							
HW Access	R							
Retention	RET							
Name	ImplCode							

The ETM ID Register holds the ETM architecture variant, and precisely defines the programmer's model for the ETM.

Bits	Name	Description
31:24	ImplCode[7:0]	Implementor code. The following code is defined, all other values are reserved by ARM Limited: 0x41 = A (ARM Limited).
20	BrPcktEnc	Branch packet encoding implemented: If this bit is not set (b0), the ETM implements the original branch packet encoding. If this bit is set (b1), the ETM implements the alternative branch packet encoding.
19	TrustZoneSupp	TrustZone support. If this bit is not set (b0), then the ETM behaves as if the processor is in secure state at all times. If this bit is set (b1), the TrustZone architectural extensions are supported by the processor.

1.3.1565   ETM_ETM_ID (continued)

18	Thumb2Supp	Thumb-2 support. If this bit is not set (b0), BL and BLX immediate are traced as two instructions. Exceptions might occur between these instructions. If this bit is set (b1), the Thumb-2 architectural extensions are supported by the processor. Thumb 32-bit BL/BLX instructions are traced as one instruction.
16	LoadPCFirst	Load pc first. If this bit is set to b1, LSMs with the pc in the list load the pc first, followed by the other registers in the normal order. This can be decompressed by using the following procedure: 1. Calculate the number of items transferred by the LSM by looking at the code image. 2. As each item is read, assign an address equal to 4 greater than the previous one as normal. 3. When the number of items read equals the total number of items transferred, subtract (4 * number of items) from each address other than the first.
15:12	CoreFam[3:0]	Core family. The meaning of this field depends on the value of the Implementor Code.The following apply if Implementor code = A (ARM Limited), and are the only values that are defined. All other values are reserved by ARM Limited: b0000 = ARM7 core b0001 = ARM9 core b0010 = ARM10 core b0011 = ARM11 core b1111 = Defined elsewhere The value of these bits is 0b1111, indicating that the processor family is not identified in this register.
11:8	MajorETMArchVer[3:0]	Major ETM architecture version number, see The ETM architecture version: b0000 = ETMv1 b0001 = ETMv2 b0010 = ETMv3
7:4	MinorETMArchVer[3:0]	Minor ETM architecture version number
3:0	ImplRev[3:0]	Implementation revision.

1.3.1566 ETM_CFG_CODE_EXT

Configuration Code Extension Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_CFG_CODE_EXT: 0xE00411E8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000					R:000		
HW Access	R					R		
Retention	RET					RET		
Name	SzExtInBus					NumExtInSel		

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:000			R:1	R:1	R:000		
HW Access	R			R	R	R		
Retention	RET			RET	RET	RET		
Name	NumInstr			DataAd- drSupp	RegRead- able	SzExtInBus		

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:0	R:1	R:0	R:1	R:0100			
HW Access	NA	R	R	R	R			
Retention	NA	RET	RET	RET	RET			
Name	RSVD	Time- stampingIm- pl	EmbICEBe- hCtrl	TraceSSBlk	NumEmbICE			

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00		R:0	R:1	R:1	NA:000		
HW Access	NA		R	R	R	NA		
Retention	NA		RET	RET	RET	NA		
Name	RSVD		Timestamp- Sz	Timestam- pEnc	RedFuncCtr	RSVD		

The Configuration Code Extension Register holds additional bits for ETM configuration code. This register describes the extended external inputs.

Bits	Name	Description
29	TimestampSz	Timestamp size. Set to 0 to indicate a size of 48 bits.
28	TimestampEnc	Timestamp encoding. Set to 1 to indicate that the timestamp is encoded as a natural binary number.
27	RedFuncCtr	Reduced function counter. Set to 1 to indicate that Counter 1 is a reduced function counter.
22	TimestampingImpl	This bit is set to 1, indicating that timestamping is implemented.

1.3.1566   ETM_CFG_CODE_EXT (continued)

21	EmbICEBehCtrl	EmbeddedICE Behavior Control Register implemented. This bit is b1 if the register is implemented, and b0 if it is not implemented.
20	TraceSSBlk	Trace Start/Stop block can use EmbeddedICE watchpoint inputs. This bit is b1 if the Trace Start/Stop block can used these inputs, and is b0 otherwise.
19:16	NumEmbICE[3:0]	Number of EmbeddedICE watchpoint inputs implemented. This field can take any value from b0000 (0 inputs) to b1000 (8 inputs).
15:13	NumInstr[2:0]	Number of Instrumentation resources supported. The maximum value of this field is b100, for four Instrumentation resources.
12	DataAddrSupp	Set to b1 if data address comparisons are not supported.
11	RegReadable	Set to b1 if all registers are readable.
10:3	SzExtInBus[7:0]	Size of extended external input bus. This field must be 0 if bits [2:0] are 0.
2:0	NumExtInSel[2:0]	Number of extended external input selectors.

1.3.1567 ETM_TR_SS_EMBICE_CTRL

Trace Start/Stop EmbeddedICE Control Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_TR_SS_EMBICE_CTRL: 0xE00411F0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				StrtResSel			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Trace Start/Stop EmbeddedICE Control Register specifies the EmbeddedICE watchpoint comparator inputs that are used as trace start and stop resources.

Bits	Name	Description
19:16	StpResSel[3:0]	Stop resource selection. Setting a bit in this field to b1 selects the corresponding EmbeddedICE watchpoint input as a TraceEnable stop resource. Bit [16] corresponds to input 1, bit [17] to input 2, and this pattern continues up to bit [19] corresponding to input 4.
3:0	StrtResSel[3:0]	Start resource selection. Setting a bit in this field to b1 selects the corresponding EmbeddedICE watchpoint input as a TraceEnable start resource. Bit [0] corresponds to input 1, bit [1] to input 2, and this pattern continues up to bit [3] corresponding to input 4.

1.3.1568 ETM_CS_TRACE_ID

CoreSight Trace ID Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_CS_TRACE_ID: 0xE0041200

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0	R/W:0000000						
HW Access	NA	R						
Retention	NA	RET						
Name	RSVD	TraceID						

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The CoreSight Trace ID Register defines the 7-bit Trace ID, for output to the trace bus.

Bits	Name	Description
6:0	TraceID[6:0]	Trace ID to output onto the trace bus. At reset this register is 0x00.

1.3.1569 ETM_OS_LOCK_ACCESS

OS Lock Access Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_OS_LOCK_ACCESS: 0xE0041300

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

The OS Lock Access Register (OSLAR) is used to lock and unlock access to ETM debug registers.

Bits	Name	Description
31:0	LOCK_UNLOCK_ACCESS[31:0]	Write 0xC5ACCE55 to this field to lock the ETM debug registers. Write any other value to this field to unlock the ETM debug registers.

1.3.1570 ETM_OS_LOCK_STATUS

OS Lock Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_OS_LOCK_STATUS: 0xE0041304

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R:1	R:0	R:0
HW Access	NA					W	W	W
Retention	NA					RET	RET	RET
Name	RSVD					Access32	Locked	LockImpl

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The OS Lock Status Register (OSLSR) is used to find whether the ETM debug registers are locked. It can also be used to find whether ETM debug register locking is implemented on your ETM macrocell.

Bits	Name	Description
2	Access32	32-bit access bit. If ETM debug register locking is implemented then this bit is set (b1), to indicate that 32-bit access is required to write to the OS Lock Access Register to lock the ETM debug registers.
1	Locked	Locked bit: b0: ETM debug registers are not locked. b1: ETM debug registers are locked. Any access to these registers returns a slave-generated error response. The reset value of this field corresponds to the value on the DBGOSLOCKINIT pin.

1.3.1570   ETM_OS_LOCK_STATUS (continued)

| 0 | LockImpl | ETM debug register locking implemented:
 b0: OS Lock and OS Save/Restore registers are not implemented. In this case, bits [31:0] of the OS Lock Status register reads as zero.
 b1: OS Lock and OS Save/Restore registers are implemented and it is possible to set the OS Lock for this macrocell, to lock the ETM debug registers.
 The reset value of this field is Implementation-defined. |

1.3.1571 ETM_PDSR

Device Power-Down Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_PDSR: 0xE0041314

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:1
HW Access	NA							W
Retention	NA							RET
Name	RSVD							ETMPow-ered

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Indicates the power-down status of the ETM.

Bits	Name	Description
0	ETMPowered	ETM powered up. The value of this bit indicates whether you can access the ETM Trace Registers. The value of this bit is always 1, indicating that the ETM Trace Registers can be accessed.

1.3.1572 ETM_ITMISCIN

Integration Test Miscellaneous Inputs

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_ITMISCIN: 0xE0041EE0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:000			R:0	NA:00		R:00	
HW Access	NA			W	NA		W	
Retention	NA			RET	NA		RET	
Name	RSVD			COREHALT	RSVD		EXTIN	

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Integration test.

Bits	Name	Description
4	COREHALT	A read of this bit returns the value of the COREHALT input pin.
1:0	EXTIN[1:0]	A read of these bits returns the value of the EXTIN[1:0] input pins.

1.3.1573 ETM_ITTRIGOUT

Integration Test Trigger Out

Reset: N/A

Register : Address

ETM_ITTRIGOUT: 0xE0041EE8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							W:U
HW Access	NA							R
Retention	NA							NONRET
Name	RSVD							TRIGGER

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Integration test. You must set bit [0] of ETMITCTRL to use this register.

Bits	Name	Description
0	TRIGGER	TRIGGER output value. A write to this bit sets the TRIGGER output.

1.3.1574 ETM_ITATBCTR2

ETM Integration Test ATB Control 2

Reset:　　　System reset for retention flops [reset_all_retention]

Register : Address

ETM_ITATBCTR2: 0xE0041EF0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000000							R:1
HW Access	NA							W
Retention	NA							RET
Name	RSVD							ATREADY

Bits	15	14	13	12	11	10	9	8

Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Integration Mode Control Register is used to enable topology detection or to check integration testing.

Bits	Name	Description
0	EnIntTest	When set to b1, the device goes into an integration mode to enable Topology Detection or Integration Testing to be checked. At reset this bit is b0.

1.3.1577 ETM_CLM_TAG_SET

Claim Tag Set Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_CLM_TAG_SET: 0xE0041FA0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:1111			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				ClaimTagSet			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Claim Tag Set Register is used to set bits in the claim tag and find the number of bits supported by the claim tag.

Bits	Name	Description
3:0	ClaimTagSet[3:0]	On reads, returns 0xF. On writes, a 1 in a bit position causes the corresponding bit in the claim tag value to be set.

1.3.1578 ETM_CLM_TAG_CLR

Claim Tag Clear Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_CLM_TAG_CLR: 0xE0041FA4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:0000				R/W:0000			
HW Access	NA				R			
Retention	NA				RET			
Name	RSVD				ClaimTagClear			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA

Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Claim Tag Clear Register is used to clear bits in the claim tag to b0, and to find the current value of the claim tag.

Bits	Name	Description
3:0	ClaimTagClear[3:0]	On reads, returns the current claim tag value. On writes, a 1 in a bit position causes the corresponding bit in the claim tag value to be cleared to b0.

1.3.1579 ETM_LOCK_ACCESS

Lock Access Register

Reset:　　　　System reset for retention flops [reset_all_retention]

Register : Address

ETM_LOCK_ACCESS: 0xE0041FB0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	W:00000000							
HW Access	R							
Retention	RET							
Name	LOCK_UNLOCK_ACCESS							

The Lock Access Register (LAR or LOCKACCESS) is used to lock and unlock access to all other ETM registers.

Bits	Name	Description
31:0	LOCK_UNLOCK_ACCESS[31:0]	A write of 0xC5ACCE55 unlocks the ETM. A write of any other value locks the ETM. Writes to this register from an interface that ignores the lock registers are ignored.

1.3.1580 ETM_LOCK_STATUS

Lock Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_LOCK_STATUS: 0xE0041FB4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	NA:00000					R:0	R:0	R:0
HW Access	NA					W	W	W
Retention	NA					RET	RET	RET
Name	RSVD					Access32	Locked	LockImpl

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Lock Status Register has two uses: - If you read this register from any interface, you can check bit [0] to find out whether the lock registers are implemented for the interface you are using. - If you read this register from an interface for which lock registers are implemented, you can check bit [1] to find out whether the registers are currently locked.

Bits	Name	Description
2	Access32	Reads as b0. Indicates that the Lock Access Register is 32 bits.
1	Locked	Indicates if the ETM is locked: b1: Writes are ignored b0: Writes are permitted. If this register is accessed from an interface where the lock registers are ignored, this field reads as b0 regardless of whether the ETM is locked.

1.3.1580 ETM_LOCK_STATUS (continued)

0   LockImpl   Indicates if the lock registers are implemented for this interface:
                                       b1: This access is from an interface that requires the ETM to be unlocked
                                       b0: This access is from an interface that ignores the lock registers.

1.3.1581 ETM_AUTH_STATUS

Authentication Status Register

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ETM_AUTH_STATUS: 0xE0041FB8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:11		R:00		R:00		R:00	
HW Access	W		W		R		W	
Retention	RET		RET		RET		RET	
Name	NonInvSupp		SInvSupp		NSNonInvSupp		NSInvSupp	

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

Bits	23	22	21	20	19	18	17	16

SW Access:Reset	NA:00000000							
HW Access	NA							
Retention	NA							
Name	RSVD							

The Authentication Status Register reports the level of tracing currently permitted by the authentication signals provided to the ETM.

Bits	Name	Description
7:6	NonInvSupp[1:0]	Reads as b11: Permission for secure non-invasive debug is supported by the ETM.
5:4	SInvSupp[1:0]	Reads as b00: Secure invasive debug not supported by the ETM.

1.3.1581   ETM_AUTH_STATUS (continued)

3:2	NSNonInvSupp[1:0]	Permission for Non-secure non-invasive debug. This field is only implemented if the processor core implemented with the ETM supports the TrustZone security extensions. When this field is implemented the permitted values are: b10: Non-secure non-invasive debug disabled b11: Non-secure non-invasive debug enabled. This field is a logical OR of the NIDEN and DBGEN signals. It takes the value b11 when the OR is TRUE, and b10 when the OR is FALSE. If the core does not support the TrustZone extensions, bits [3:2] are reserved, read as b00.
1:0	NSInvSupp[1:0]	Reads as b00: Non-secure invasive debug not supported by the ETM.

1.3.1582 ETM_DEV_TYPE

Device Type Register

ROM Table Peripheral Identification Register 5

Bits	Name	Description
31:0	PID5[31:0]	Peripheral Identification Register 5

1.3.1605 ROM_TABLE_PID6

ROM Table Peripheral Identification Register 6

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ROM_TABLE_PID6: 0xE00FFFD8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID6							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID6							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID6							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID6							

ROM Table Peripheral Identification Register 6

Bits	Name	Description
31:0	PID6[31:0]	Peripheral Identification Register 6

1.3.1606 ROM_TABLE_PID7

ROM Table Peripheral Identification Register 7

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ROM_TABLE_PID7: 0xE00FFFDC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID7							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID7							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID7							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID7							

ROM Table Peripheral Identification Register 7

Bits	Name	Description
31:0	PID7[31:0]	Peripheral Identification Register 7

1.3.1607 ROM_TABLE_PID0

ROM Table Peripheral Identification Register 0

Reset: Reset Signals Listed Below

Register : Address

ROM_TABLE_PID0: 0xE00FFFE0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:UUUUUUUU							
HW Access	R/W							
Retention	NONRET							
Name	part_num_0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID0							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID0							

ROM Table Peripheral Identification Register 0

Bits	Name	Description
31:8	PID0[23:0]	Peripheral Identification Register 0
7:0	part_num_0[7:0]	Peripheral Identification Register 0 - Part Number [7:0]

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	part_num_0[7:0]
System reset for retention flops [reset_all_retention]	PID0[23:0]

1.3.1608 ROM_TABLE_PID1

ROM Table Peripheral Identification Register 1

Reset: Reset Signals Listed Below

Register : Address

ROM_TABLE_PID1: 0xE00FFFE4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:UUUU				W:UUUU			
HW Access	R/W				R/W			
Retention	NONRET				NONRET			
Name	jep106_id_0				part_num_1			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID1							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID1							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID1							

ROM Table Peripheral Identification Register 1

Bits	Name	Description
31:8	PID1[23:0]	Peripheral Identification Register 1
7:4	jep106_id_0[3:0]	Peripheral Identification Register 1 - JEP106 identity code [3:0]
3:0	part_num_1[3:0]	Peripheral Identification Register 1 - Part Number [11:8]

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	part_num_1[3:0], jep106_id_0[3:0]
System reset for retention flops [reset_all_retention]	PID1[23:0]

1.3.1609 ROM_TABLE_PID2

ROM Table Peripheral Identification Register 2

Reset: Reset Signals Listed Below

Register : Address

ROM_TABLE_PID2: 0xE00FFFE8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:UUUU				W:1	W:UUU		
HW Access	R/W				R/W	R/W		
Retention	NONRET				RET	NONRET		
Name	revision				always_set	jep106_id_1		

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID2							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID2							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID2							

ROM Table Peripheral Identification Register 2

Bits	Name	Description
31:8	PID2[23:0]	Peripheral Identification Register 2
7:4	revision[3:0]	Peripheral Identification Register 2 - Revision
3	always_set	Peripheral Identification Register 2 - Always set. Indicates that a JEDEC assigned value is used
2:0	jep106_id_1[2:0]	Peripheral Identification Register 2 - JEP106 identity code [6:4]

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	jep106_id_1[2:0], revision[3:0]

1.3.1609   ROM_TABLE_PID2 (continued)

Reset Table

System reset for retention flops [reset_all_retention]	always_set, PID2[23:0]

1.3.1610 ROM_TABLE_PID3

ROM Table Peripheral Identification Register 3

Reset: Reset Signals Listed Below

Register : Address

ROM_TABLE_PID3: 0xE00FFFEC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	W:UUUU				R:0000			
HW Access	R/W				R/W			
Retention	NONRET				RET			
Name	part_num_2				cust_mod			

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID3							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID3							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	PID3							

ROM Table Peripheral Identification Register 3

Bits	Name	Description
31:8	PID3[23:0]	Peripheral Identification Register 3
7:4	part_num_2[3:0]	Peripheral Identification Register 3 - RevAnd equals Part Number [15:12]
3:0	cust_mod[3:0]	Peripheral Identification Register 3 - Customer Modified

Reset Table

Reset Signal	Applicable Register Bit(s)
N/A	part_num_2[3:0]
System reset for retention flops [reset_all_retention]	cust_mod[3:0], PID3[23:0]

1.3.1611 ROM_TABLE_CID0

ROM Table Component Identification Register 0

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ROM_TABLE_CID0: 0xE00FFFF0

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00001101							
HW Access	R/W							
Retention	RET							
Name	CID0							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID0							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID0							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID0							

ROM Table Component Identification Register 0

Bits	Name	Description
31:0	CID0[31:0]	Component Identification Register 0

1.3.1612 ROM_TABLE_CID1

ROM Table Component Identification Register 1

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ROM_TABLE_CID1: 0xE00FFFF4

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00010000							
HW Access	R/W							
Retention	RET							
Name	CID1							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID1							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID1							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID1							

ROM Table Component Identification Register 1

Bits	Name	Description
31:0	CID1[31:0]	Component Identification Register 1

1.3.1613 ROM_TABLE_CID2

ROM Table Component Identification Register 2

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ROM_TABLE_CID2: 0xE00FFFF8

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:00000101							
HW Access	R/W							
Retention	RET							
Name	CID2							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID2							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID2							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID2							

ROM Table Component Identification Register 2

Bits	Name	Description
31:0	CID2[31:0]	Component Identification Register 2

1.3.1614 ROM_TABLE_CID3

ROM Table Component Identification Register 3

Reset: System reset for retention flops [reset_all_retention]

Register : Address

ROM_TABLE_CID3: 0xE00FFFFC

Bits	7	6	5	4	3	2	1	0
SW Access:Reset	R:10110001							
HW Access	R/W							
Retention	RET							
Name	CID3							

Bits	15	14	13	12	11	10	9	8
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID3							

Bits	23	22	21	20	19	18	17	16
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID3							

Bits	31	30	29	28	27	26	25	24
SW Access:Reset	R:00000000							
HW Access	R/W							
Retention	RET							
Name	CID3							

ROM Table Component Identification Register 3

Bits	Name	Description
31:0	CID3[31:0]	Component Identification Register 3

Revision History

Revision History

Document Title: PSoC® 5LP REGISTERS TRM (TECHNICAL REFERENCE MANUAL)				
Document Number: 001-82120				
Revision	ECN#	Issue Date	Origin of Change	Description of Change
**	3754878	09/25/2012	VVSK	Initial release
*A	3818220	11/21/2012	VVSK	Corrected Rev. ** ECN number
*B	4136833	09/27/2013	AESA	Incorporated updates through 09/26/2013
*C	4446701	10/27/2014	AESA	Updated CM3_SYSTCK_SRCSEL in PANTHER_WAITPIPE Register Updated avail_main in PM_AVAIL_CR4 Register Updated vsel_enum (vsel[4:0]) in BOOST_CR0 Register Updated nobat in BOOST_SR Register Updated CMP[0..3]_TR0 and CMP[0..3]_TR1 Registers Updated wait[1:0], delay[1:0], lockdet ilock changed to high_phase_error for FASTCLK_PLL_CFG0 and FASTCLK_PLL_SR Registers Updated extmode, clk_ilo, and clk_eco for BOOST_CR1 and BOOST_CR4 Registers
*D	4817281	06/30/2015	AESA	Updated bitfield description in CAN_TX_CMD, CAN_RX_CMD registers, and NVIC_SYSTICK_RELOAD. Corrected NMI_SRCSEL DSI connection to DSI_01_OUT_P_11.
*E	5475303	10/14/2016	SHEA	Updated logo and copyright disclaimer
*F	5758771	01/06/2017	SHEA	Updated logo and copyright information
